# EXECUTIVE SUMMARY

## PROJECT TRIP GENERATION

The proposed project is estimated to generate 169 vehicle trips (120 inbound, 49 outbound) during the weekday AM peak hour and 201 vehicle trips (70 inbound, 131 outbound) during the weekday PM peak hour. The existing Draeger's supermarket is estimated to generate 304 vehicle trips (167 inbound, 137 outbound) during the weekday AM peak hour and 432 vehicle trips (216 inbound, 216 outbound) during the weekday PM peak hour. The proposed project generates fewer AM and PM peak hour trips when compared to the AM and PM peak hour trips currently being generated by the existing Draeger's supermarket.

## CEQA ANALYSIS

This project is located within a half mile of the San Mateo Downtown Caltrain station, and it meets the detailed screening criteria requirements to be considered within a High-Quality Transit Area (HQTA) per the City VMT Guidelines. In meeting at least one of the five screening criteria, the proposed project can be presumed to result in a less than significant VMT impact and therefore is exempted from the detailed VMT analysis.

## LOCAL TRANSPORTATION ANALYSIS

Kittelson conducted the intersection level of service analysis at all five study intersections for Existing, Baseline (Opening Year), Baseline (Opening Year) Plus Project, Cumulative, and Cumulative Plus Project Conditions for weekday AM and PM peak hour traffic conditions. Kittelson reviewed the site access and on-site circulation based on the proposed site plan and the changes in the 95th percentile queue lengths caused by the proposed project at the study intersections. The results for all scenarios are presented in the report below. The proposed project would not cause any study intersections to exceed the level of service standard as specified in the City of San Mateo TIA guidelines in the existing, baseline (opening year), and cumulative conditions.<sup>1</sup> Storage capacity is exceeded for the EB and SB approaches at 4<sup>th</sup> Ave and B St in the AM and PM Cumulative and Cumulative Plus Project scenarios as well as the EB only approach at 4<sup>th</sup> Ave and Ellsworth in the Cumulative and Cumulative Plus Project PM scenarios . Although storage capacity is exceeded in these scenarios, queue lengths do not increase with respect to plus project scenarios when compared to no project scenarios. Thus, the proposed project does not impact the status quo.

---

<sup>1</sup> City of San Mateo Transportation Impact Analysis Guidelines, 2020.

## Section 1 Introduction

# INTRODUCTION

This report documents the California Environmental Quality Act (CEQA) analysis findings and the local transportation analysis conducted for the proposed 222 E. 4th Avenue Draeger's Site Mixed Use Project development in San Mateo, California (Figure 1).

## PROJECT DESCRIPTION

### PROJECT LOCATION

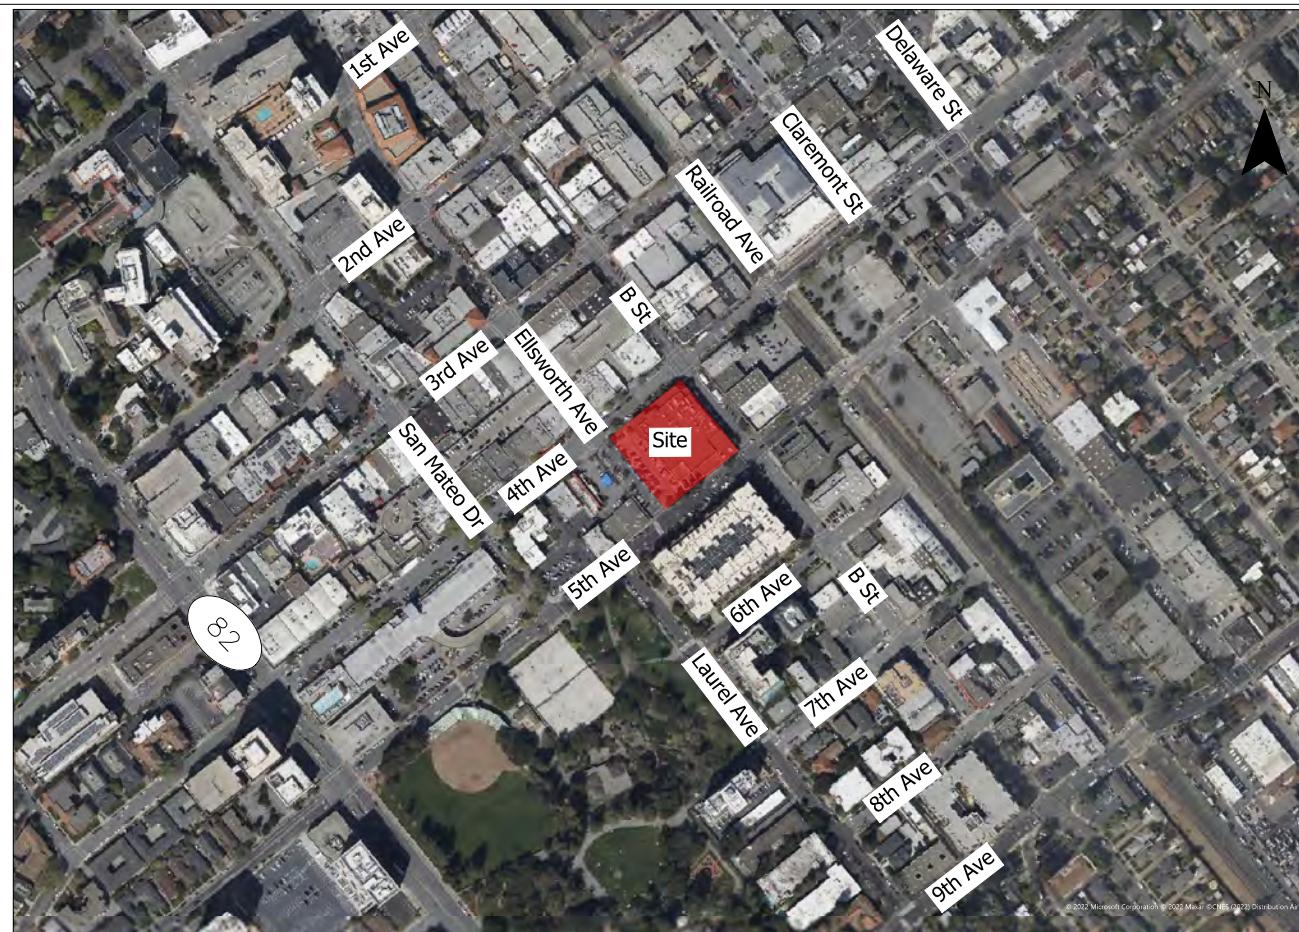

The proposed project is located at 222 East 4<sup>th</sup> Avenue and is approximately 0.4 miles from the San Mateo Caltrain downtown station. Vehicular access to the site is proposed on 5<sup>th</sup> Avenue, where the garage entry/exit is provided. In addition, pedestrian and bike access to the garage is through a shared lobby on the east by B Street. The residential lobby is provided midblock on the east by B Street, the office lobby is provided midblock on the west by Ellsworth Avenue, and retail entrance is provided on the north by 4<sup>th</sup> Avenue. Nearby land uses include residential, commercial/retail, recreational, and a hospital. San Mateo Central Park is located to the southwest of the site. The Project site is in downtown San Mateo and is zoned as Central Business District/Residential Overlay District – Mixed Use (CBD).

## EXISTING AND PROPOSED USES

The existing site is the Draeger's grocery store, consisting of 60,965 SF.

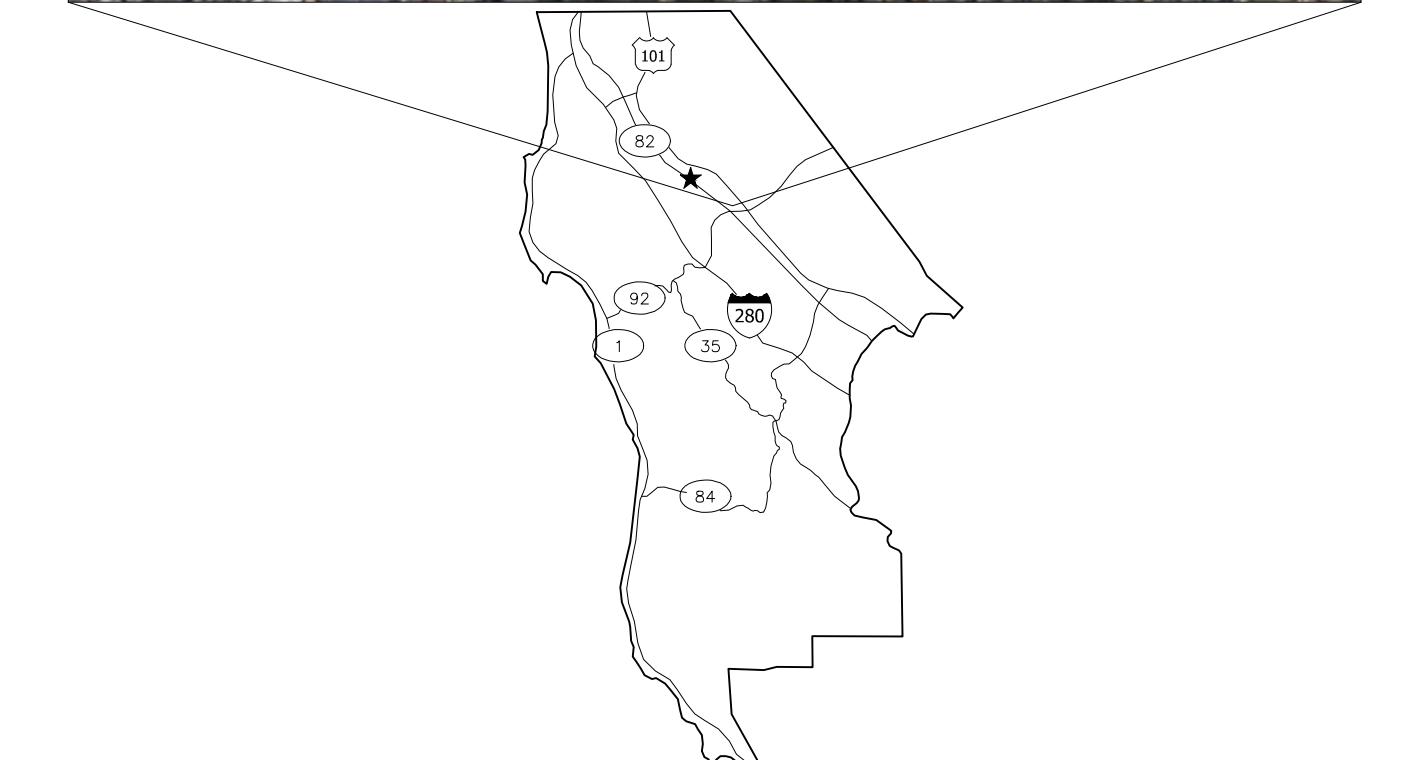

Lane Partners is proposing to replace the existing 60,965 square feet Draeger's market located at 222 East 4<sup>th</sup> Avenue with a 5-story, approximately 152,533 square feet mixed-use building with two levels of below grade parking. The building would consist of approximately 104,554 square feet of office space, 17,658 square feet of retail space, and 8,997 square feet of residential space for 10 below-market-rate units at the lower income level. The retail floor would be located on the ground floor, the office space would be spread throughout the first four floors, and the residential space would be split between the ground floor (i.e., residential lobby/elevator) and the fifth floor living areas. The ground floor would also include 12,392 square feet of covered parking area and two levels (89,519 square feet) below grade for a total of 221 parking spaces. The Project site plan is shown in Figure 2. Regional access to the project is via State Route 82 (El Camino Real), and US 101 via 4<sup>th</sup> Avenue and 5<sup>th</sup> Avenue. Local access to the project site would be provided by 5<sup>th</sup> Avenue, 4<sup>th</sup> Avenue, Ellsworth Avenue, and B Street.

2Figure  
2

## TRANSPORTATION DEMAND MANAGEMENT PLAN

The project would implement a Transportation Demand Management (TDM) Plan to encourage sustainable modes of transportation and reduce vehicle trips to and from the site. The TDM Plan is being developed by Steer Group as part of this project.

## SCOPE OF STUDY

The purpose of this transportation analysis is to determine whether the proposed project would have transportation impacts, as defined by the City of San Mateo's Traffic Impact Analysis Guidelines, developed in accordance with the City's General Plan and the Governor's Office of Planning and Research (OPR) requirements in July 2020. The analysis covers the following topics:

## CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA) ANALYSIS

Senate Bill (SB) 743 changed the way transportation studies are conducted in California Environmental Quality Act (CEQA) documents. Specifically, SB 743 updated the way transportation impacts are measured for development projects, based on the number of daily trips and the distance traveled by those trips to their destinations (VMT). The technical advisory provided by the OPR specifically addresses the requirements of California SB 743 which mandated specific types of CEQA analysis of land use development and transportation projects effective July 1, 2020. The quantitative methodology, significance thresholds, and mitigation measures for conducting transportation analysis are based on VMT metrics.

## LOCAL TRANSPORTATION ANALYSIS

The City of San Mateo requires the analysis of unsignalized and signalized intersections, though it does not require the analysis of roadway segments, in compliance with the 2030 General Plan. Since a roadway segment's capacity is generally controlled by the downstream intersection, an intersection analysis is sufficient for assessing a project's impacts. Based on the discussions with City Staff and the approved scope of work, Kittelson evaluated the following under the local transportation analysis section:

- Site Access and On-Site Circulation
  - Vehicular Access
  - Pedestrian Access
  - Bicyclist Access
  - Transit Access
  - Emergency Vehicle Access
- Intersection Operations
  - Level of Service
  - Vehicle Queueing

## Section 2

### CEQA Analysis

# CEQA ANALYSIS

## SCREENING CRITERIA

According to the technical advisory by OPR<sup>2</sup> and the more specific City VMT/TIA Guidelines<sup>3</sup>, a project may require a detailed VMT analysis unless it meets at least one of the City's five screening criteria:

1. *Small Projects* – As per the OPR advisory and the City VMT/TIA Guidelines, projects that generate or attract fewer than 110 vehicle trips per day are classified as 'small projects'. This proposed project has 10 residential units; 104,554 square feet of office space, and 17,658 square feet of retail space and generates 2,904 vehicle trips per day (Detailed trip generation is described in technical memo from Kittelson, dated August 22, 2022). The project generated trips are more than this screening threshold permits. **The project does not meet this criterion.**
2. *Affordable Housing* – As per the guidelines, residential projects that consist entirely of 100 percent deed restricted affordable housing are presumed to have a less than significant impact. The proposed project is a mixed-use development consisting of residential, office, and retail use. **The project does not meet this criterion.**
3. *Local-Serving Retail and Public Services* – As per the guidelines, projects that are locally serving retail with 50,000 square feet gross floor area or less are presumed to have a less than significant impact. The proposed project is a mixed use development and while the retail portion is only 17,658 square feet and therefore can be screened out, the building's office use cannot. **The project does not meet this criterion.**
4. *High-Quality Transit Area (HQTA)* – As per the guidelines, projects located within a HQTA do not require a detailed VMT analysis. The proposed project is in a high-quality transit area as specified by the City's HQTA map (Attachment A of the City's TIA Guidelines) which is included here as Figure 3. This exemption from a detailed VMT analysis does not apply if any of the following are true about the project:
  - a. Project has a floor area ratio (FAR) of less than 0.75 – **false**. The FAR for this proposed project development is 3.1.
  - b. Project includes more parking for use by residents, customers, or employees of the project than required by the jurisdiction – **false**. The off-street parking requirement is determined by the Downtown Area Plan and the Downtown Specific Planning Area and Central Parking and Improvement District (CPID). Table 1 shows the minimum required amount of parking for the proposed project. The City requires 320 parking stalls based on the project characteristics. The project is providing 221 parking stalls.
  - c. Project is inconsistent with the applicable Metropolitan Transportation Commissions' (MTC) Sustainable Communities Strategy (SCS), as determined by the City - **false**. The City has not indicated that this project is out of alignment with the MTC SCS.

<sup>2</sup> Technical Advisory on Evaluating Transportation Impacts in CEQA, Governor's Office of Planning and Research, December 2018.

<sup>3</sup> City of San Mateo Transportation Impact Analysis Guidelines, 2020.

- d. Project replaces affordable units with a smaller number of moderate- or high-income residential units – **false**. This project is not replacing any affordable residential units.

**The proposed project meets the HQTA criterion and does not exhibit any of the characteristics which would exempt it from satisfying this screening.**

**Table 1: City of San Mateo Parking Requirements and Proposed Project Parking Spaces Calculation**

Land use type	San Mateo Off-Street Parking Requirements (per 1,000 Gross Square Feet (SF) of Floor Area)			Proposed Project Parking Calcs	
	Employee/Resident	Visitor/Customer	Total	Total Units/Area	Parking Spaces
Office	2.4	0.2	2.6	104,554 SF	273
Retail	1.4	0.5	1.9	17,658 SF	34
<i>Residential</i>					
One-bedroom	1.0	0.2	1.2	8	10
Studio	1.0	0.2	1.2	2	3
				<b>Total</b>	<b>320</b>

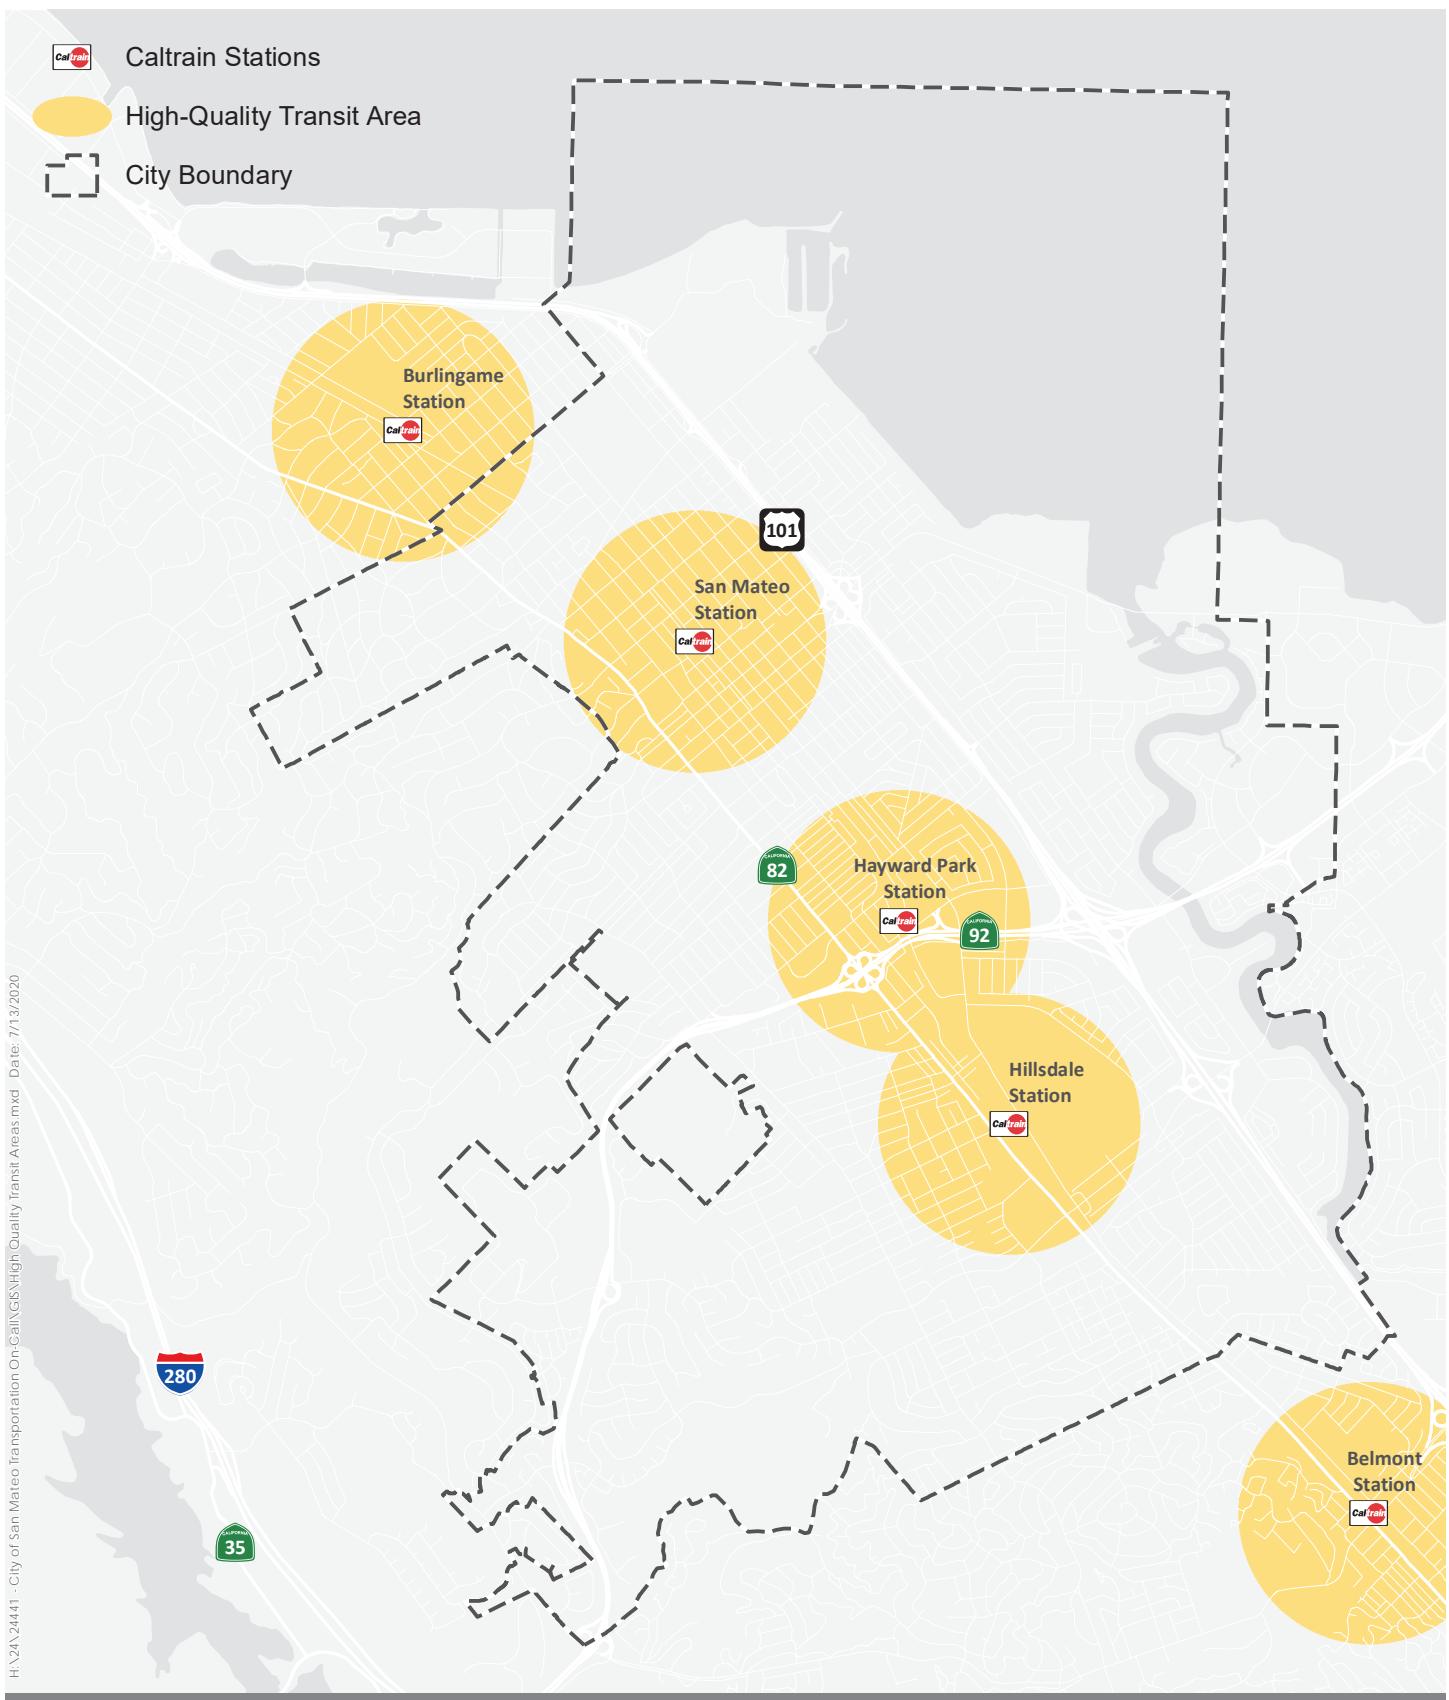

5. Project Located in Low VMT Areas – Projects that are proposed in areas that generate VMT below adopted City thresholds are presumed to have a less than significant VMT impact and thus can be screened out. The thresholds and project types that may be screened out are:
- Residential projects proposed in TAZs with total daily resident based VMT per capita that is 15% less than the existing regional average for the County of San Mateo. This is a mixed-use project and does not meet this criterion – **false**.
  - Office or employment portions of other non-residential uses with total daily employee based VMT per employee that is 15% less than the existing regional average for the County of San Mateo. The proposed mixed-use project is in Transportation Analysis Zone (TAZ) 3066 with VMT per Employee of 14.9. The San Mateo County has a regional average of 18.0 VMT per Employee with an impact threshold of 15.3 VMT per Employee (15% below regional average) for this mixed-use project – **true**.

**The proposed project is a mixed-use development that includes retail, office, and residential uses. While the nonresidential component of the proposed project screens out, the overall project does not screen out as the residential thresholds are not applicable for the mixed-use project.**

## VMT IMPACT DISCUSSION

A review of the OPR Technical Advisory and City TIA Guidelines has determined that the project meets the minimum of one of the five of the VMT screening criteria - it is in a High-Quality Transit Area. Therefore, the project is presumed to have a less than significant impact on VMT and is exempt from detailed VMT analysis.

## Section 3

### Local Transportation Analysis

# LOCAL TRANSPORTATION ANALYSIS

## SCOPE OF STUDY

### TIME PERIODS

Traffic conditions at the study intersections were analyzed for the weekday a.m. (7-9 am) and p.m. peak (4-6 pm) hours of adjacent street traffic. It is during these peak commute periods that the traffic demand on the roadway system is the greatest.

Kittelson obtained the multimodal intersection turning movement counts at three of the five study intersections from the City for the weekday a.m. (7-9 am) and p.m. (4-6 pm) peak periods when the existing project site generated trips. These intersections included: E 5<sup>th</sup> Ave/Ellsworth Avenue, E 5<sup>th</sup> Ave/B Street, and E 4<sup>th</sup> Ave/B Street. The multimodal intersection turning movement counts for E 4<sup>th</sup> Ave/Ellsworth Ave and E 5<sup>th</sup> Ave/Laurel Ave were obtained using the Streetlight data. These turning movement counts obtained from Streetlight data were adjusted so that the intersection entry and exit volumes match the adjacent counts collected at the other study intersections. After these checks were performed, it was observed that the counts obtained from Streetlight data at E 5<sup>th</sup> Ave/Laurel Ave seemed to be overestimated when compared to the adjacent intersections. Hence, counts were collected at this intersection of E 5<sup>th</sup> Ave/Laurel Ave and these collected counts were used for analyzing traffic conditions as part of this project.

Transportation conditions were evaluated for the following scenarios:

- *Existing Conditions.* Traffic volumes for the Existing Conditions were estimated using historical counts and Streetlight data, as collecting turning movement volumes at the study intersections was not recommended due to COVID-19<sup>4</sup> conditions. However, due to unavailability of accurate multimodal count data at E 5<sup>th</sup> Ave/Laurel Ave, Kittelson collected counts at this one intersection.
- *Baseline (Opening Year) Conditions.* Baseline (Opening Year) traffic volumes were estimated by adding the projected volumes from approved, but not yet completed land use development and transportation projects to existing peak hour volumes for the project completion year.
- *Baseline (Opening Year) Plus Project Conditions.* Baseline (Opening Year) traffic volumes with the project were estimated by adding the additional traffic generated by the project to the approved/baseline (opening year) traffic volumes. Baseline (Opening Year) Plus Project Conditions were evaluated relative to Baseline (Opening Year) Conditions to determine the effects the proposed project would have on the Baseline (Opening Year) roadway network.
- *Cumulative Conditions.* Cumulative Conditions are represented by future traffic volumes on the roadway network. This scenario was estimated by adding a regional growth to existing traffic volumes between the existing year and future year (2040).
- *Cumulative Plus Project Conditions.* Cumulative traffic volumes with the project are estimated by adding cumulative traffic volumes to the additional traffic generated by the project. Cumulative

---

<sup>4</sup> The COVID-19 pandemic resulted in shelter-in-place orders across the Bay Area and travel demand was significantly reduced across all modes. Travel patterns also changed substantially. These changes are the result of multiple factors such as school closures, restrictions on business operations, and an increased amount of telecommuting.

Plus Project Conditions were evaluated relative to Cumulative Conditions to determine the effects the proposed project would have on the future roadway network.

## STUDY INTERSECTIONS

The following five study intersections were selected for analysis and are shown in Figure 6. Intersections with an asterisk indicate counts obtained using Streetlight data.

1. E 5th Avenue/Laurel Avenue
2. E 5th Avenue/Ellsworth Avenue
3. E 5<sup>th</sup> Avenue/B Street
4. E 4th Avenue/B Street
5. E 4th Avenue/ Ellsworth Avenue\*

## INTERSECTION LEVEL OF SERVICE (LOS) CRITERIA

Level of service (LOS) describes the operating conditions experienced by motorists. LOS is a qualitative measure of the effect of a number of factors, including speed and travel time, traffic interruptions and delay, freedom to maneuver, driving comfort, and convenience. LOS A through LOS F covers the entire range of traffic operations that might occur. Motorists using a facility that operates at a LOS A experience very little delay, while those using a facility that operates at a LOS F will experience long delays. Intersection analyses for the five study intersections were conducted using the operational methodologies outlined in the Highway Capacity Manual 6th Edition (HCM 6<sup>th</sup> Edition) methodology (Transportation Research Board, Washington, D.C., 2016), calculated with Synchro 11 software.

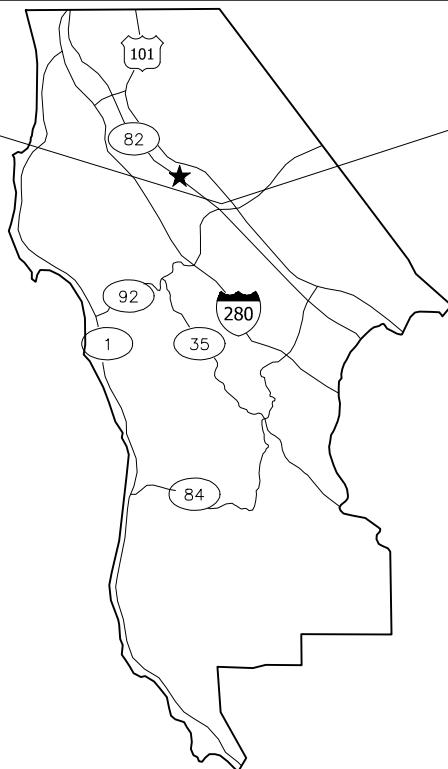

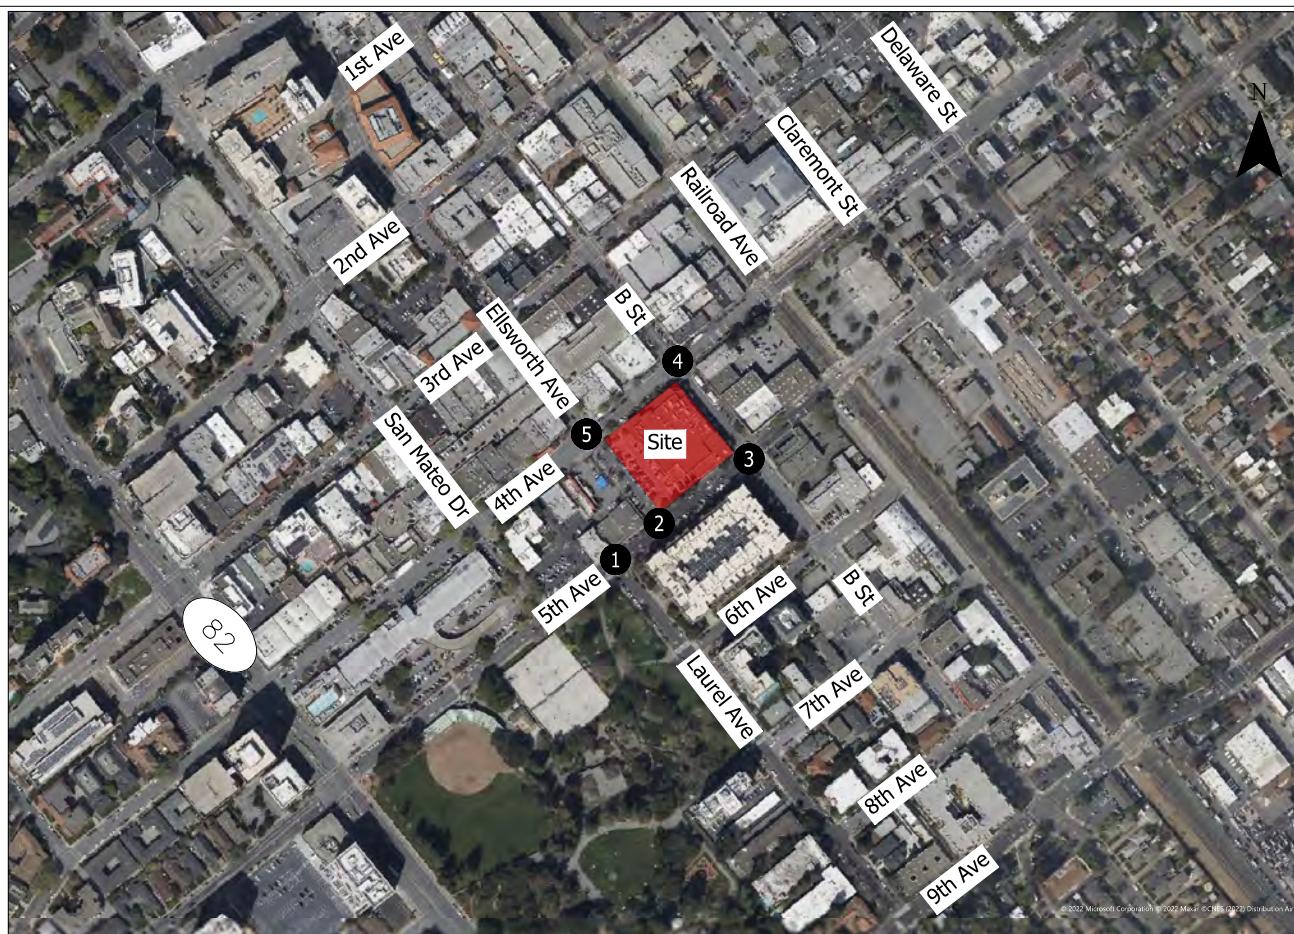

### ***Signalized Intersections***

The HCM procedure calculates a weighted average control delay in seconds per vehicle at a signalized intersection and assigns a level of service designation based upon the delay. The City of San Mateo level of service standard is mid-LOS D (delay of 45 seconds) or better for all signalized study intersections.

### ***Unsignalized Intersections***

The HCM methodology calculates a weighted average control delay in seconds per vehicle for each controlled intersection leg and for the intersection. For two-way stop-controlled intersections, the LOS for the worst approach is used as the LOS performance measure. The City of San Mateo does not have a LOS standard for unsignalized intersections as specified in the 2030 General Plan. The City adopted Transportation Impact Analysis (TIA) Guidelines in August 2020 to include LOS standards for unsignalized intersections. According to the City of San Mateo standard, unsignalized intersections should maintain a LOS no worse than LOS E.

Table 2 presents the relationship of average delay to level of service for both signalized and unsignalized intersections.

Study Intersections

Figure  
6

**Table 2: Level of Service Definition for Intersections**

Signalized Intersection	LOS	Description of Traffic Conditions	Unsignalized Intersection
Average Delay Per Vehicle (Seconds)			Average Delay Per Vehicle (Seconds)
≤10.0	A	Free flowing. Most vehicles do not have to stop.	≤10.0
>10.0 and ≤20.0	B	Minimal delays. Some vehicles have to stop, although waits are not bothersome.	>10.0 and ≤15.0
>20.0 and ≤35.0	C	Acceptable delays. Significant numbers of vehicles have to stop because of steady, high traffic volumes. Still, many pass without stopping.	>15.0 and ≤25.0
>35.0 and ≤55.0	D	Tolerable delays. Many vehicles have to stop. Drivers are aware of heavier traffic. Cars may have to wait through more than one red light. Queues begin to form, often on more than one approach.	>25.0 and ≤35.0
>55.0 and ≤80.0	E	Significant delays. Cars may have to wait through more than one red light. Long queues form, sometimes on several approaches.	>35.0 and ≤50.0
>80.0	F	Excessive delays. Intersection is jammed. Many cars have to wait through more than one red light, or more than 60 seconds. Traffic may back up into “up-stream” intersections.	>50.0

Source: Transportation Research Board, Highway Capacity Manual 6th Edition (Washington D.C., 2016)

## GENERAL PLAN LOS POLICY STANDARD

Per the City's General Plan Circulation Element Policy C 2.7 (Section E), all projects are required, at a minimum, to pay a transportation mitigation fee. The transportation mitigation fee is used to fund planned transportation improvements that are identified in the City of San Mateo Traffic Mitigation Program. The cost of the off-site improvements may be reimbursed by the City if a reimbursement program is established through the timeframe of the City of San Mateo's current Traffic Mitigation Program or at the time when the improvement was initially scheduled. In addition to paying the transportation impact fee, a development project may be required to fund off-site circulation improvements which are needed as a result of project generated traffic if:

### Signalized Intersections

- a) The level of service at the intersection drops below mid-level LOS D (average delay of more than 45 seconds) when the project traffic is added, and
- b) An intersection that operates below its level of service standard under the base year conditions experiences an increase in delay of four or more seconds, and
- c) The needed improvement of the intersection(s) is not funded in the applicable five-year City Capital Improvement Program from the date of application approval.

## ***Unsignalized Intersections***

- a) The level of service at the intersection drops from LOS E or better to LOS F (average delay of more than 50 seconds) when the project traffic is added, and
- b) An intersection that operates below its level of service standard under the base year conditions experiences an increase in delay of four or more seconds, and
- c) The needed improvement of the intersection(s) is not funded in the applicable five-year City Capital Improvement Program from the date of application approval.

Transportation studies typically evaluate whether unsignalized intersections are functioning adequately and whether signalization is warranted using the peak-hour volume signal warrant described in the California MUTCD.

# **EXISTING CONDITIONS**

## **ROADWAY NETWORK**

Regional access to the project is via State Route 82 (El Camino Real), and US 101 via 4<sup>th</sup> Avenue and 5<sup>th</sup> Avenue.

**State Route 82 (El Camino Real)** is a four-to six lane state highway in California, serving as a major north-south corridor in the Peninsula. It extends from Interstate 880 in San Jose at the south end to Interstate 280 in San Francisco at the north end. It runs parallel to the Caltrain line along much of the route. Access to and from the project study area is provided via signalized intersections at 4<sup>th</sup> Avenue and 5<sup>th</sup> Avenue.

**US 101** is a eight-to ten lane state highway in California, serving as the primary coastal route providing access to the San Francisco Bay Area. It is also the primary commuting route between San Francisco and San Jose. Access to and from the project study area is provided via interchanges at 3<sup>rd</sup> Avenue and 4<sup>th</sup> Avenue to the northeast of the project site.

**4th Avenue** is an east-west, three to four-lane arterial roadway extending from Dartmouth Road on the west and transitioning into J Hart Clinton Drive in the east after crossing US 101. Arterial roads link residential and commercial districts and serve shorter through traffic needs. In the vicinity of the project site, 4th Avenue has three to four lanes. The road is directly adjacent to the project site and is proposed to provide direct access to the project site.

**5th Avenue** is an east-west, two to three-lane arterial roadway extending from Virginia Avenue on the west and transitioning into Amphlett Boulevard in the east. Arterial roads link residential and commercial districts and serve shorter through traffic needs. In the vicinity of the project site, 5th Avenue has two lanes. The road is directly adjacent to the project site and is proposed to provide direct access.

**B Street** is a north-south, two-lane collector roadway extending from Tilton Ave on the north and transitioning into South Boulevard on the south. Collector roads link arterial roads to local roads and serve some through traffic needs. In the vicinity of the project site, B Street has two lanes. The road is directly adjacent to the project site and is proposed to provide direct access.

**Ellsworth Avenue** is a north-south, two-lane collector roadway extending from Bellevue Avenue on the north to 5<sup>th</sup> Avenue on the south. Collector roads link arterial roads to local roads and serve some through traffic needs. In the vicinity of the project site, 5th Avenue has two lanes. The road is directly adjacent to the project site and is proposed to provide direct access.

## PEDESTRIAN FACILITIES AND AMENITIES

Pedestrian facilities consist of sidewalks, crosswalks, and pedestrian signals at signalized intersections. In the project vicinity, sidewalks exist along both sides of 4<sup>th</sup> Avenue, 5<sup>th</sup> Avenue, B Street, and one side of Ellsworth Avenue through the site, providing pedestrian access to and from the project site. Marked crosswalks with pedestrian signal heads and push buttons are provided at the B Street/4<sup>th</sup> Avenue, Ellsworth Avenue/4<sup>th</sup> Avenue, and B Street/5<sup>th</sup> Avenue intersections. The overall network of sidewalks and crosswalks in the study area has excellent connectivity and provides pedestrians with safe routes to maneuver.

## BICYCLE FACILITIES AND AMENITIES

Bicycle facilities are defined by the following four classes<sup>5</sup>:

- **Class I** (Multi-use Path) – Provides a completely separated facility designed for the exclusive use of bicyclists and pedestrians with crossing points minimized.
- **Class II** (Bike Lane) – Provides a restricted right-of-way designated lane for the exclusive or semi-exclusive use of bicycles with through travel by motor vehicles or pedestrians prohibited, but with crossflows by pedestrians and motorists permitted.
- **Class III** (Bike Route/Bicycle Boulevard) – Bike route provide signage and permanent markings on low-stress roadways to increase driver awareness of people biking. No exclusive right of way is provided. Bicycle boulevards prioritize bicycle through-travel and use traffic calming to slow vehicle traffic and maintain low motor vehicle volumes. These routes are often applied on quiet streets and through residential neighborhoods.<sup>6</sup>
- **Class IV** (Separated Bike Lane) – Provides a restricted right-of-way designated lane for the exclusive use of bicyclists that is separated by a vertical element to provide further separation from motor vehicle traffic.

The existing and proposed<sup>7</sup> bicycle routes within the study area are described below. The existing bicycle network is shown in Figure 7.

**B Street** – There are currently no bicycle facilities provided on B Street through the San Mateo central business district. A buffered bike lane (Class II) is proposed along B Street from 5<sup>th</sup> Avenue south until the road transitions into South Boulevard.

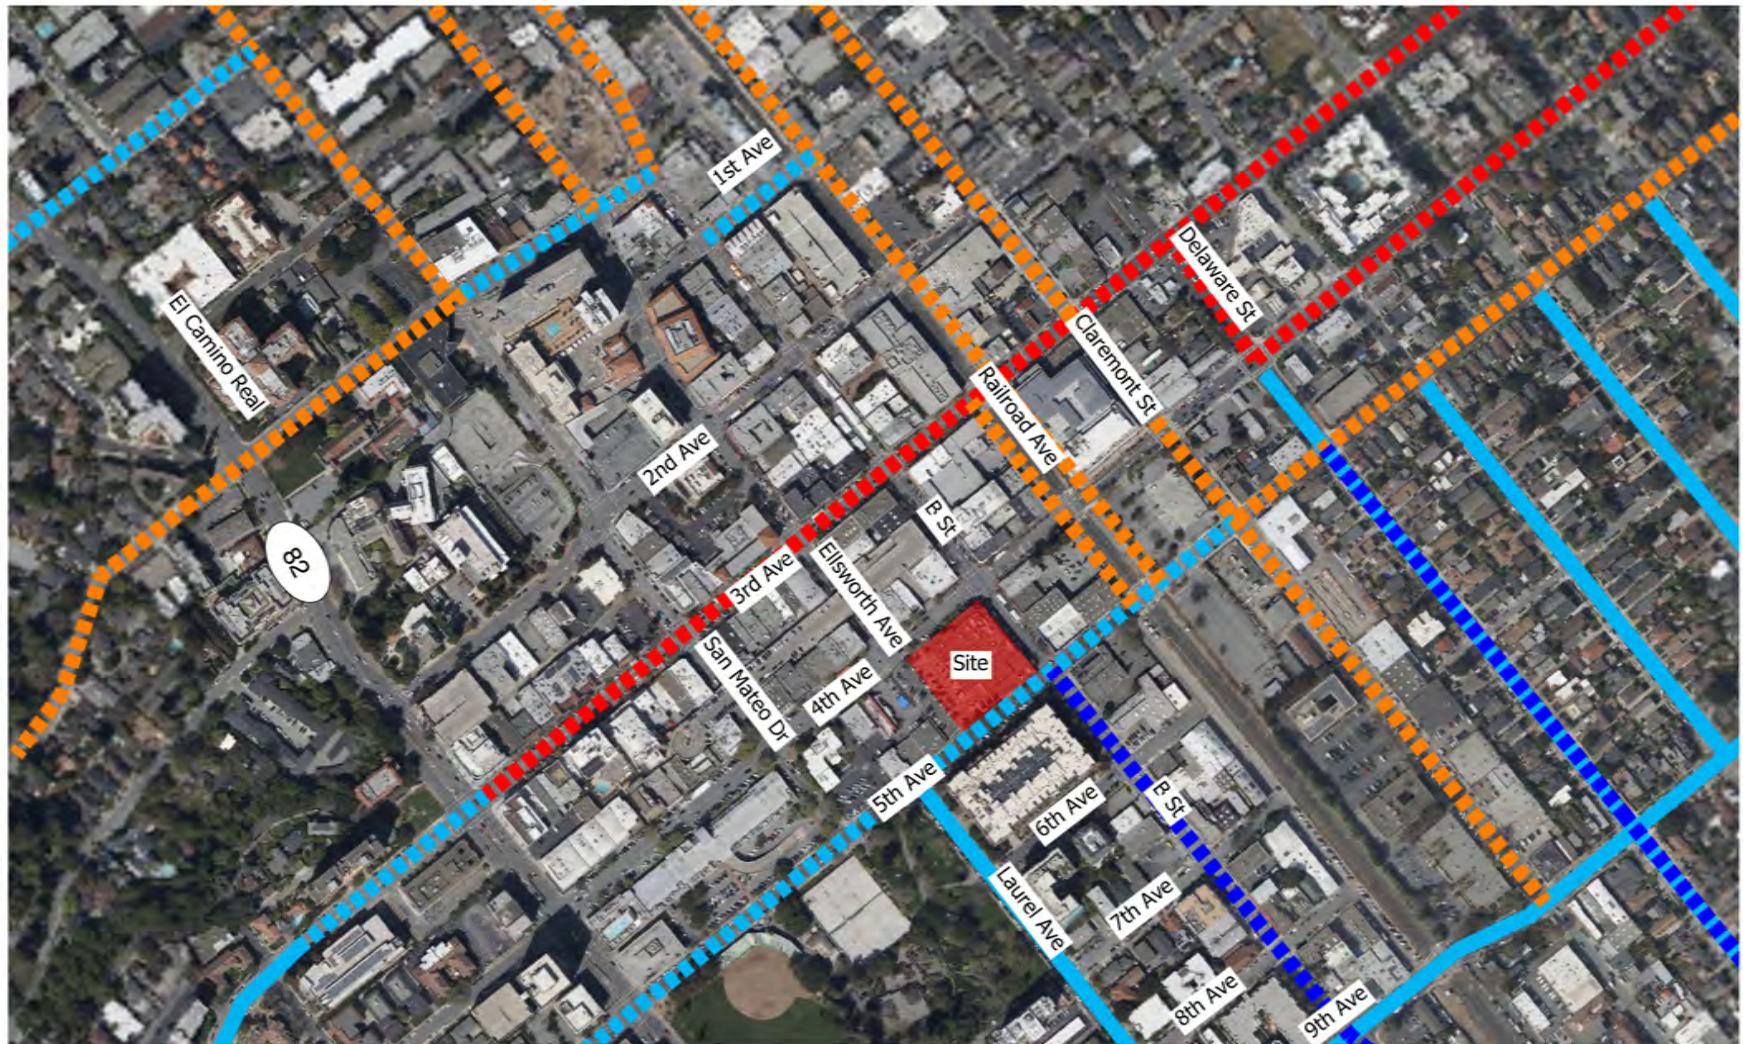

**5<sup>th</sup> Avenue** – There are currently no bicycle facilities provided on 5<sup>th</sup> Avenue through the San Mateo Central Business District. The 2020 Bicycle Master Plan proposes upgrading the corridor from Dartmouth Road to Claremont Street to a bike lane (Class II) and Claremont Street to Amphlett Boulevard to a bicycle boulevard (Class III).

**3<sup>rd</sup> Avenue** – There are currently no bicycle facilities provided on 3<sup>rd</sup> Avenue through the San Mateo Central Business District. Notably, bike lanes exist in both directions west of Dartmouth Road, but they are not connected to the central business district. The 2020 Bicycle Master Plan proposes making that connection from Dartmouth Road to El Camino Real with a bike lane (Class II) and El Camino Real to the US-101 interchange to a separated bike lane (Class IV).

5 As detailed in Chapter 1000 of the Highway Design Manual (Caltrans, 2015).

6 San Mateo Bicycle Master Plan (2020), <https://www.cityofsanmateo.org/3944/Bicycle-Master-Plan-2020>

7 As proposed in City of San Mateo Bicycle Master Plan, 2020.

**Legend:**

- - - Proposed Bike Lane (Class II)
- · - Proposed Buffered Bike Lane (Class II)
- - - Proposed Bicycle Boulevard (Class III)

**Existing and Proposed  
Bicycle Network**

**Figure  
7**

**Laurel Avenue** – There is currently a Class II bike lane provided south of 5<sup>th</sup> Avenue on Laurel Avenue. This is notable because it is the only current existing bicycle infrastructure in close proximity to the site. The 2020 Bicycle Master Plan does not propose any upgrades or changes to the existing configuration.

## TRANSIT SERVICE

The existing transit service to the study area is provided by the San Mateo County Transit District (SamTrans) and Caltrain.

### **SamTrans Service**

The project site has five bus routes nearby (Route 397, 250, 292, 295, and ECR), operated by SamTrans with the nearest bus stops located at the intersections of 4<sup>th</sup> Avenue/Ellsworth Avenue and 4<sup>th</sup> Avenue/San Mateo Drive. Three additional bus routes (school-day only) Route 53, 55, and 59 operate in the vicinity of the project site. The bus routes that provide the peak-hour services near the project site are described in Table 3 and are shown in Figure 8. Access to transit facilities will not change with the proposed site plan.

### **Caltrain Service**

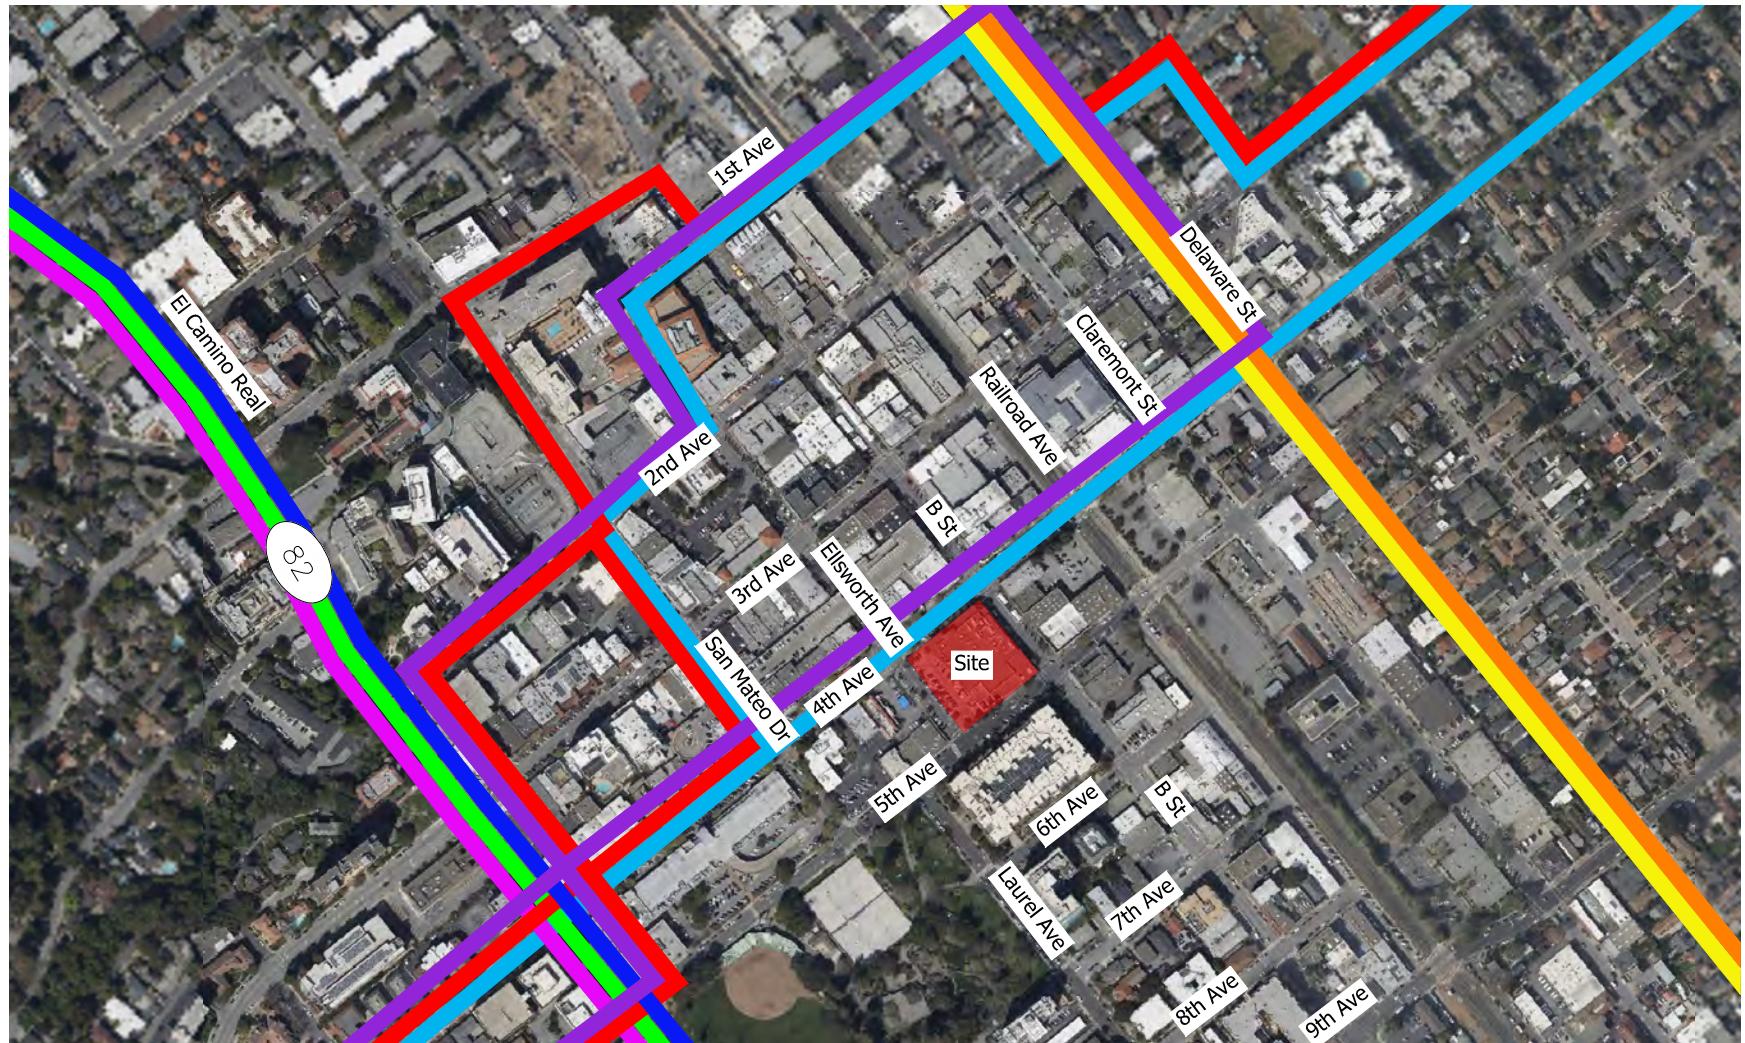

Commuter rail service between San Francisco and Gilroy is provided by Caltrain. The project site is located approximately 0.4 miles away from the San Mateo Downtown Caltrain Station. Currently, Caltrain provides northbound and southbound service at this station at a half-hour frequency during the weekday and weekend AM and PM commute hours, midday, and at nights. Per the City of San Mateo Rail Corridor Transit-Oriented Development Plan<sup>8</sup>, the proposed project site is an ideal location for a transit village.

---

<sup>8</sup>San Mateo Rail Corridor Transit-Oriented Development Plan, 2005. <https://www.cityofsanmateo.org/1899/Rail-Corridor-Transit-Oriented-Development> , Accessed 2022.

8**

## EMERGENCY VEHICLE ACCESS

The nearest fire station (San Mateo Fire Department Station #21) is located approximately 0.2 miles west of the project site at 120 S Ellsworth Ave. The proposed plans indicate that the bulb outs at each intersection surrounding the project site can accommodate the turning radius of a fire truck.

## INTERSECTION LEVEL OF SERVICE

The estimated traffic volumes due to COVID-19 conditions for four of the study intersections and collected traffic counts at Laurel Avenue/5<sup>th</sup> Avenue, lane configurations, and traffic controls for each study intersection were used to assess the Existing Conditions LOS and delay. The projected turning movement volumes for each peak hour under Existing Conditions are provided in Figure 10 and Figure 11. Detailed calculation worksheets for the Existing Conditions are provided in Appendix B. These delay and LOS values can be compared to the City of San Mateo thresholds outlined in the Circulation Element of the 2030 General Plan, discussed in the previous section.

As mentioned in the previous section, intersection analyses for the four study intersections were conducted using the operational methodologies outlined in the Highway Capacity Manual (HCM) 6<sup>th</sup> Edition methodology, calculated with Synchro 11 software.

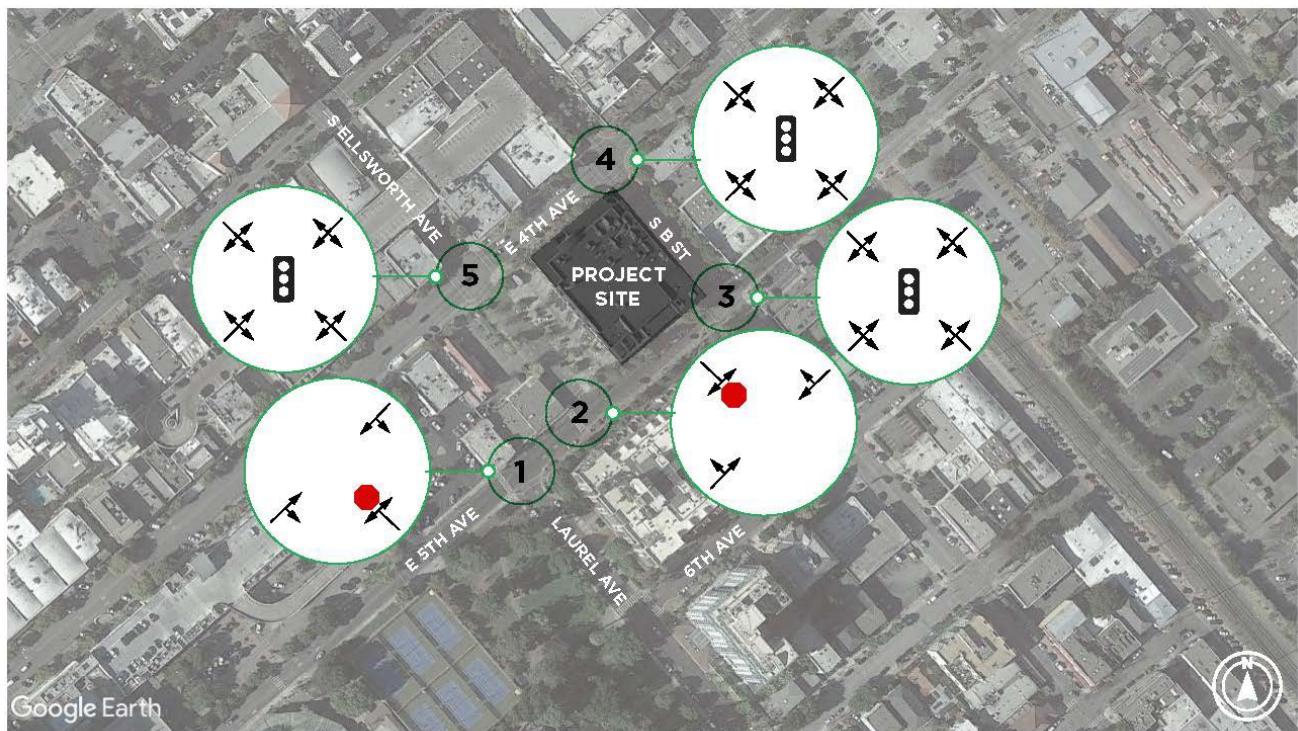

Table 4 demonstrates that all intersections operate to the City's standards under existing conditions for both the AM and PM peak hours.

**Table 4: Existing Conditions Intersection Operations Results**

#	Location	Control	AM		PM	
			Delay	LOS	Delay	LOS
1	E 5 <sup>th</sup> Avenue/Laurel Avenue	TWSC	15.1	C	15.3	C
2	E 5 <sup>th</sup> Avenue/Ellsworth Avenue	TWSC	12.2	B	12.7	B

# BASELINE (OPENING YEAR) CONDITIONS

This section presents Baseline (Opening Year) traffic conditions, which are defined as conditions just prior to the completion of the proposed project. Traffic volumes for the Baseline (Opening Year) Conditions comprise volumes from existing traffic counts and traffic generated by other approved developments in the project vicinity.

## TRANSPORTATION NETWORK

The Baseline (Opening Year) Conditions analysis assumes the same lane configuration and traffic control at all the study intersections as the existing conditions, as shown in Figure 9.

## INTERSECTION LEVEL OF SERVICE

Traffic volumes for the Baseline (Opening Year) Conditions were calculated using the existing estimated traffic volumes, shown in Figure 10 and Figure 11, plus the traffic volumes generated by new developments within the site vicinity. Through conversations with the city, the new developments added to the existing volumes are as follows:

- 406 E 3<sup>rd</sup> Avenue Office & Residential Mixed-Use Development
- 480 E 4<sup>th</sup> Avenue Residential Development
- 405 E 4<sup>th</sup> Avenue (mixed-use office and residential)

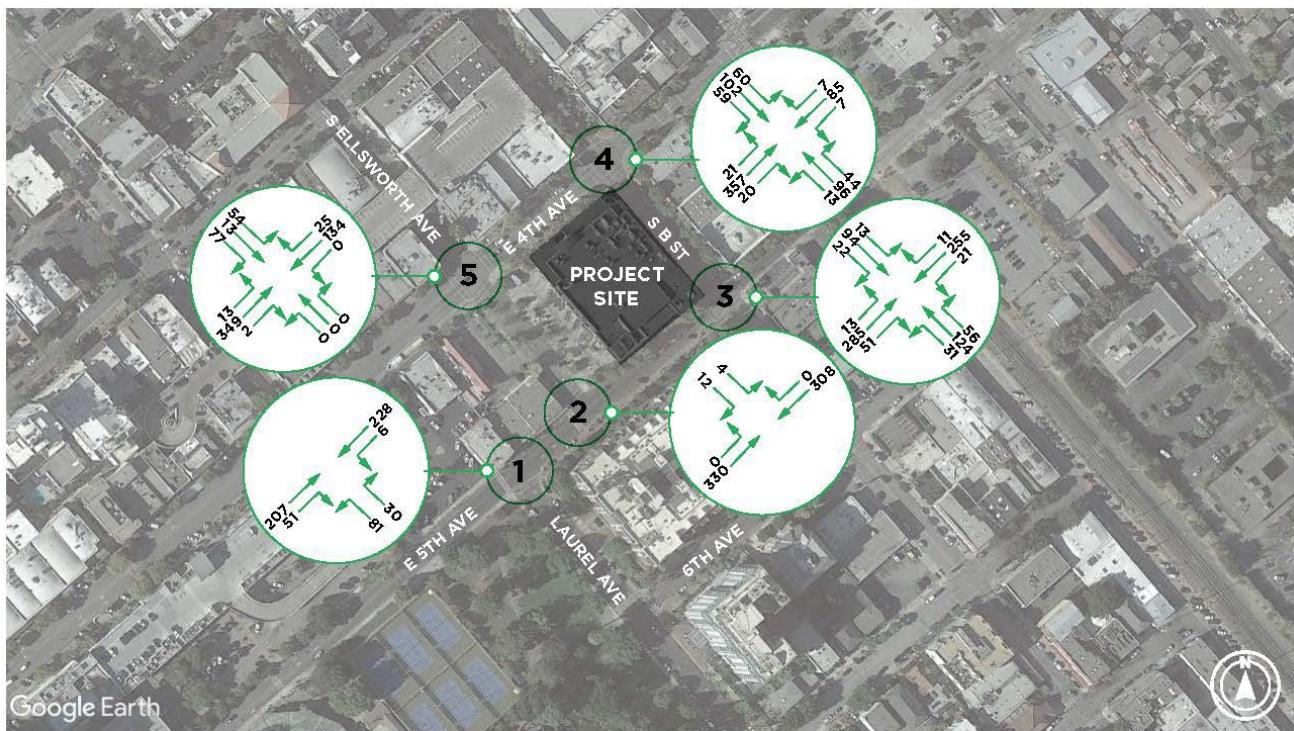

The projected turning movement volumes for each peak hour under Baseline (Opening Year) Conditions are provided in Figure 12 and Figure 13. Table 5 shows the Baseline (Opening Year) intersection operations for the AM and PM peak hours, respectively. Detailed calculation worksheets for the Baseline (Opening Year) Conditions are provided in Appendix C. All intersections operate to the City's standards under Baseline (Opening Year) conditions under both the AM and PM peak hours.

**Table 5: Baseline (Opening Year) Conditions Intersection Operations Results**

# PROJECT TRAVEL DEMAND

## TRIP GENERATION

Trip generation is a key consideration for determining local effects of the project on the transportation network. Trip generation rates published in the Institute of Transportation Engineers (ITE) Trip Generation Manual 11<sup>th</sup> Edition were used to estimate the number of trips the mixed-use proposed project would generate. ITE trip estimates are tied to specific land use codes. The ITE land use codes found to be most applicable to the Project are listed below.

- Supermarket (ITE 850)
- General Office Building (ITE 710)
- Affordable Housing (ITE 223)

In addition, this Project is assumed to be in the '**Dense Multi-Use Urban**' context, considered by ITE to be an area that has diverse and interacting complementary land uses with good pedestrian connectivity, and convenient and frequent transit service. This is consistent with the Transit Oriented Development overlay and CBD zoning for the project site for which the San Mateo Municipal code promotes mixed-uses and pedestrian activity.

As summarized in Table 6, the proposed project is estimated to generate 169 vehicle trips (120 inbound, 49 outbound) during the weekday AM peak hour and 201 vehicle trips (70 inbound, 131 outbound) during the weekday PM peak hour. The existing Draeger's supermarket is estimated to generate 304 vehicle trips (167 inbound, 137 outbound) during the weekday AM peak hour and 432 vehicle trips (216 inbound, 216 outbound) during the weekday PM peak hour. The proposed project generates less AM and PM peak hour trips when compared to the AM and PM peak hour trips currently being generated by the existing Draeger's supermarket.

## TRIP DISTRIBUTION AND ASSIGNMENT

The vehicle trip distribution assumptions are based on the existing counts and proximity to the major arterials, state routes, and freeways. As noted above, the proposed project would generate less peak hour trips with a reduction of 135 trips in the morning peak hour and 231 trips in the afternoon peak hour when compared to the trips generated from the existing site. The driveways for the existing site are situated on Ellsworth Avenue, and the driveway for the proposed project site is situated on 5<sup>th</sup> Avenue. Vehicle traffic going to/from the existing and proposed project site are distributed at each intersection according to the turning movement proportions consistent with the existing counts and the vehicle trip distribution percentages are determined for AM and PM peak hour. The complete project travel demand memorandum submitted to the City is provided in Appendix A.

**Table 6: Project Trip Generation**

Land Use	Size	Weekday Daily Trips	Weekday AM Peak Hour			Weekday PM Peak Hour		
			In	Out	Total	In	Out	Total
<b>Proposed Project</b>								
Retail (Supermarket)	17.6 KSF	1,891	48	40	88	82	82	164
Office Space	104.7 KSF	1,208	77	11	88	15	76	91
Affordable Housing	10 DU	38	1	4	5	2	2	4
Internal Capture		-233	-6	-6	-12	-11	-11	-22
Pass-by reduction (24% PM only)		0	0	0	0	-18	-18	-36
<b>Total Proposed Project Trips</b>		<b>2,904</b>	<b>120</b>	<b>49</b>	<b>169</b>	<b>70</b>	<b>131</b>	<b>201</b>
<b>Existing Project</b>								
Retail (Supermarket)	61 KSF	6,549	167	137	304	284	284	568
Pass-by reduction (24% PM only)		0	0	0	0	-68	-68	-136
<b>Total Existing Trips</b>		<b>6,549</b>	<b>167</b>	<b>137</b>	<b>304</b>	<b>216</b>	<b>216</b>	<b>432</b>
<b>Net New Project Trips</b>		<b>-3,645</b>	<b>-47</b>	<b>-88</b>	<b>-135</b>	<b>-146</b>	<b>-84</b>	<b>-231</b>

Updated square footage for the retail portion of the proposed project from 104.7 KSF to 104.5 KSF did not change the proposed project trips generated.

## BASELINE PLUS PROJECT CONDITIONS

### INTERSECTION LEVEL OF SERVICE

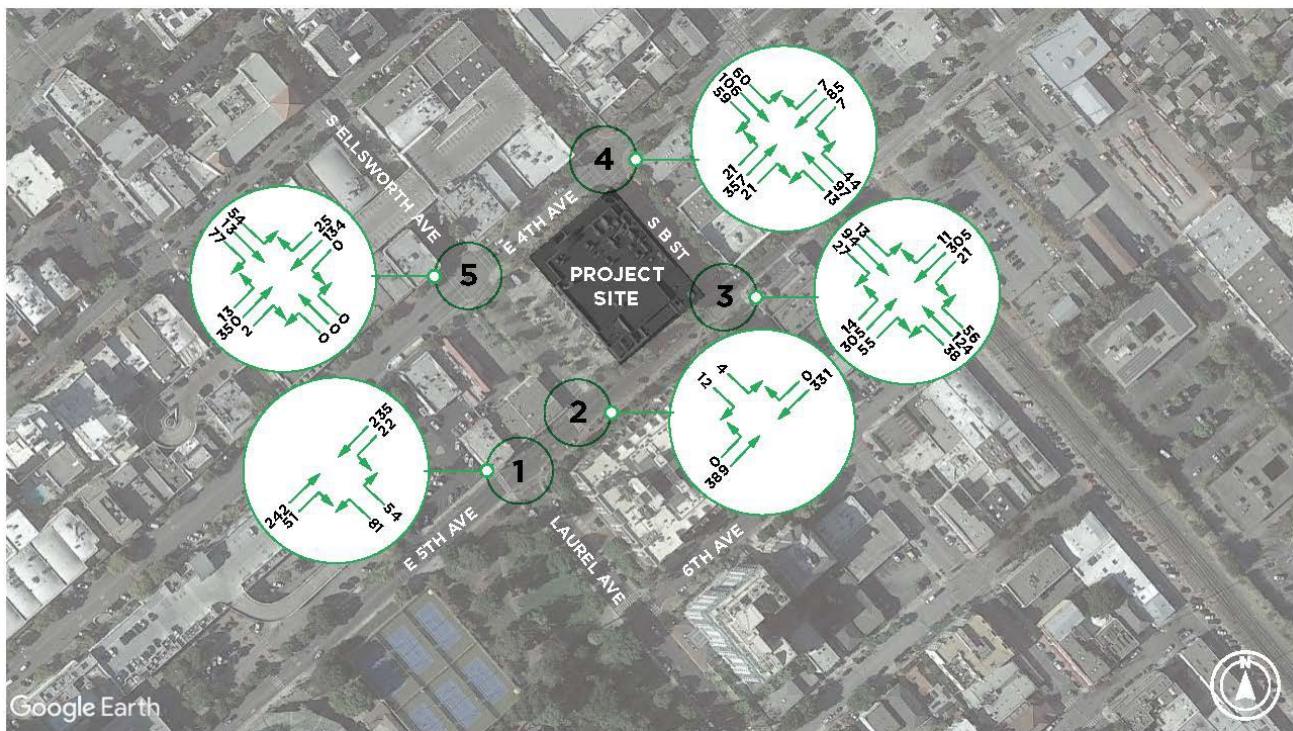

Traffic volumes for the Baseline (Opening Year) Plus Project Conditions were developed by combining the Baseline estimated traffic volumes with the project only volumes. The resulting Baseline Plus Project turning movement volumes are shown in Figure 14 and Figure 15. Table 7 shows the Baseline Plus Project intersection operations for the AM and PM peak hours, respectively. Detailed calculation worksheets are provided in Appendix D. All intersections operate to the City's standards under Baseline Plus Project conditions under both the AM and PM peak hours.

**Table 7: Baseline (Opening Year) Plus Project Conditions Intersection Operations Results**

#	Location	Control	AM		PM	
			Delay	LOS	Delay	LOS
1	E 5th Avenue/Laurel Avenue	TWSC	14.4	B	14.3	B
2	E 5 <sup>th</sup> Avenue/Ellsworth Avenue	TWSC	11.7	B	11.9	B
3	E 5 <sup>th</sup> Avenue/B Street	Signal	14.6	B	15.6	B
4	E 4 <sup>th</sup> Avenue/B Street	Signal	9.7	A	10.3	B
5	E 4 <sup>th</sup> Avenue/Ellsworth Avenue	Signal	7.1	A	9.2	A

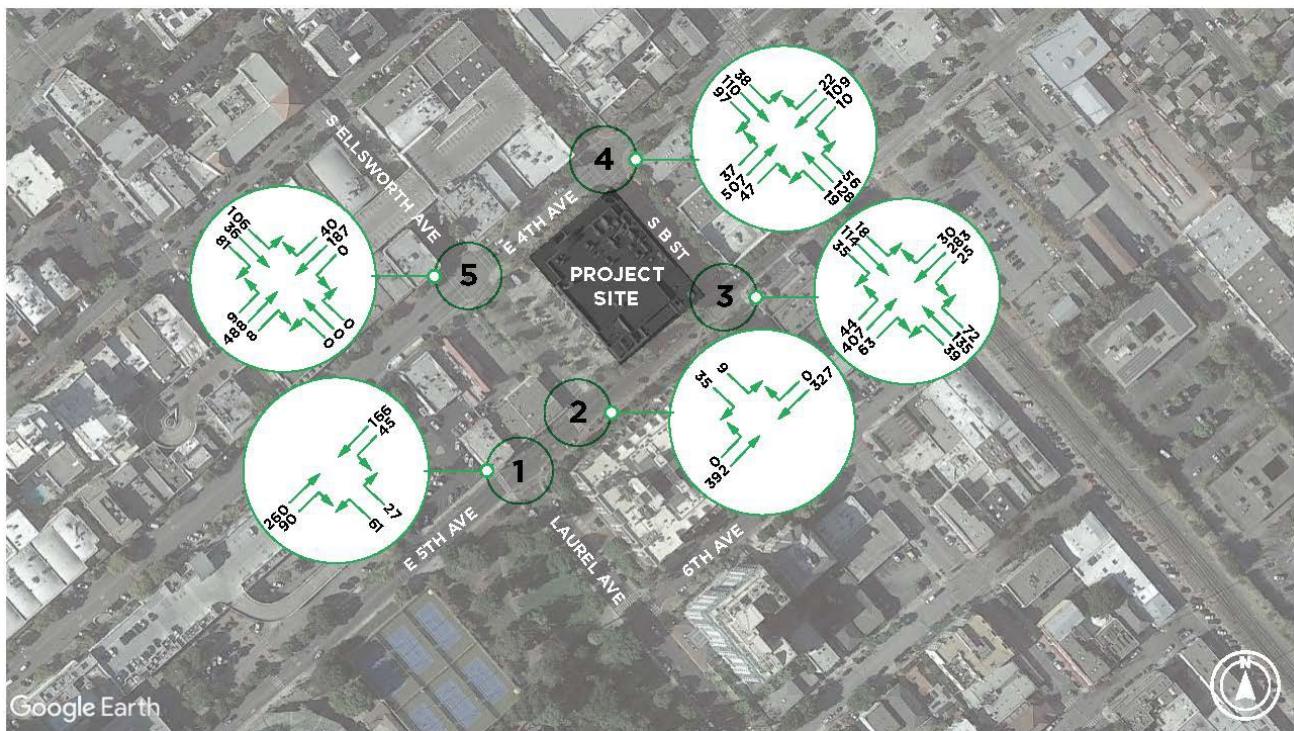

Notes: Bold lettering indicates an intersection that does not meet the City's minimum acceptable design level of service (LOS D for Signalized intersections); TWSC = Two-Way Stop Control; AM = weekday a.m. peak hour; PM = weekday p.m. peak hour; LOS = Level of Service; Delay reported in seconds per vehicle; No = intersection number. ## CUMULATIVE CONDITIONS

This section presents the anticipated Cumulative conditions for the study intersections for the year 2040 and the effect the addition of the project trips would have on them.

## LAND USE DEVELOPMENT AND TRANSPORTATION NETWORK CHANGES

The C/CAG San Mateo County Travel Demand Model was used to develop the future volume forecast for Cumulative Conditions. The model includes future development throughout the region. The 2040 cumulative forecasts are consistent with regional growth totals projected by the Association of Bay Area Governments (ABAG) Plan Bay Area<sup>9</sup>. Therefore, the traffic forecasts reflect traffic reflecting both growth in 222 East 4<sup>th</sup> Avenue mixed use project and increases in traffic volumes on State Route 82 and US 101 due to regional growth. Base year (Year 2019) and future year (Year 2040) forecasts were extracted from the model and linearly interpolated to develop growth between the estimated existing traffic counts (2019) and the current model horizon year (2040). The intersection lane configurations under cumulative conditions were assumed to be the same as described under the existing conditions.

## INTERSECTION LEVEL OF SERVICE

The projected turning movement volumes for each peak hour under Cumulative Conditions are provided in Figure 16 and Figure 17. Based on these volumes and lane configurations, the cumulative operations at the study intersections are shown in Table 8. Detailed calculation worksheets for the Cumulative Conditions are provided in Appendix E. All intersections operate to the City's standards under Cumulative conditions under both the AM and PM peak hours.

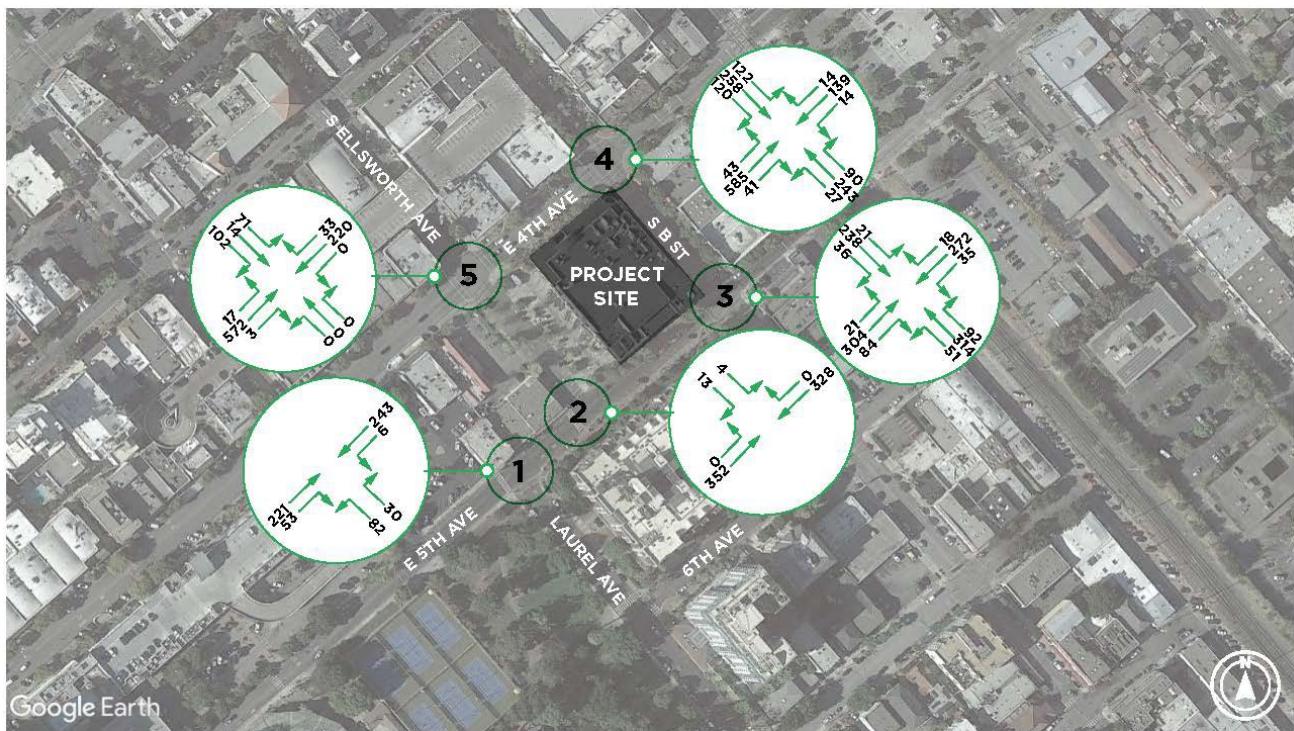

Table 8: Cumulative Conditions Intersection Operations Results

#	Location	Control	AM		PM	
			Delay	LOS	Delay	LOS
1	E 5 <sup>th</sup> Avenue/Laurel Avenue	TWSC	13.7	B	13.5	B
2	E 5 <sup>th</sup> Avenue/Ellsworth Avenue	TWSC	11.5	B	11.7	B
3	E 5 <sup>th</sup> Avenue/B Street	Signal	11.5	B	14.1	B
4	E 4 <sup>th</sup> Avenue/B Street	Signal	10.8	B	11.5	B
5	E 4 <sup>th</sup> Avenue/Ellsworth Avenue	Signal	7.6	A	10.7	B

Notes: Bold lettering indicates an intersection that does not meet the City's minimum acceptable design level of service (LOS D for Signalized intersections); TWSC = Two-Way Stop Control; AM = weekday a.m. peak hour; PM = weekday p.m. peak hour; LOS = Level of Service; Delay reported in seconds per vehicle; No = intersection number. Figure 17: Cumulative Conditions Peak Hour (PM) Turning Movement Volumes

## SAN MATEO CUMULATIVE VOLUMES **PM**

## CUMULATIVE PLUS PROJECT CONDITIONS

This section discusses the effect of proposed project on traffic operations under Cumulative Conditions. Traffic volumes for the Cumulative Plus Project Conditions were developed using the same additive approach used for the Baseline (Opening Year) Plus Project volumes.

### INTERSECTION LEVEL OF SERVICE

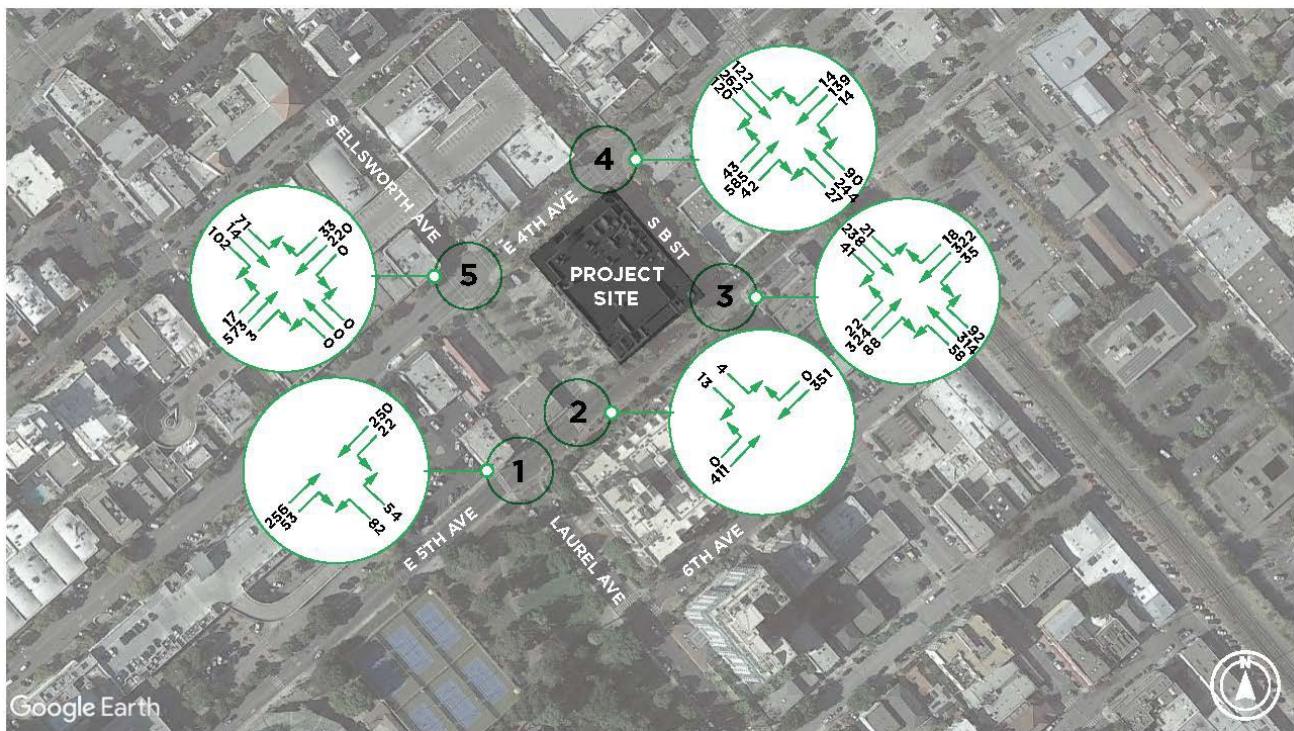

Based on these volumes and lane configurations, the Cumulative Plus Project volumes are shown in Figure 18 and Figure 19 and the operations at the study intersections are shown in Table 9. Detailed calculation worksheets for the Cumulative Plus Project Conditions are provided in Appendix F. Based on the significance criteria previously described the proposed project would not cause operational deficiencies at any of the study intersections.

**Table 9: Cumulative Plus Project Intersection Operations Results**

#	Location	Control	AM		PM	
			Delay	LOS	Delay	LOS
1	E 5 <sup>th</sup> Avenue/Laurel Avenue	TWSC	15.0	C	15.0	C
2	E 5 <sup>th</sup> Avenue/Ellsworth Avenue	TWSC	12.0	B	12.3	B
3	E 5 <sup>th</sup> Avenue/B Street	Signal	11.9	B	14.8	B
4	E 4 <sup>th</sup> Avenue/B Street	Signal	11.0	B	11.7	B
5	E 4 <sup>th</sup> Avenue/Ellsworth Avenue	Signal	7.6	A	10.7	B

# ADDITIONAL TRANSPORTATION ANALYSIS

This section describes additional transportation analysis related to site access and circulation of the proposed project based on a review of the proposed site plan. This section includes analysis of the following characteristics and scenarios:

- Vehicular access and on-site circulation
  - Vehicle parking
  - Driveway sight distance
- Pedestrian, Bicycle, and Transit access
- Loading zone and garbage truck circulation and access
- Emergency vehicle access
- 95<sup>th</sup> percentile queue analysis

The analysis in the following sections, while informed by adopted State and local standards, is driven by professional judgement. Citations are provided where applicable and available. References to the proposed project characteristics and geometric features are per the most recent site plan published February 2022.<sup>10</sup>

## VEHICULAR ACCESS AND ON-SITE CIRCULATION

Site access and on-site circulation were evaluated using commonly accepted transportation design, planning principles and professional judgment. The site access and circulation were evaluated to determine the adequacy of site's driveways with regard to traffic volumes, delays, vehicle queues, geometric design, site distance, and truck access. In general, the site plan shows adequate site access at the project driveways and circulation within the site.

The proposed project would replace the existing Draeger's market with a mixed-use building. The project proposes to construct a parking garage with a 24 ft wide driveway fronting the north side of 5<sup>th</sup> Avenue. The drive aisle in the garage level would be 24 ft wide, which is adequate for two-way circulation of vehicular traffic and complies with the width requirement for two-way turning aisles or ramps.

In detail, the project proposes to construct a three-level parking garage with ground floor including 12,392 square feet of covered parking area and two levels (89,519 square feet) below grade for a total of 221 parking spaces. Vehicle parking will include a mix of compact, standard, accessible (standard), accessible (van), and EV charging stations. Angled parking will be retained along the project frontage on Ellsworth Avenue and 4<sup>th</sup> Avenue. There is angled on-street parking on the south side on 5<sup>th</sup> Avenue which is being restriped to parallel stalls. A review of City Standard Drawings for parking stalls<sup>11</sup> found that the project's proposed parking dimensions are in compliance with City specifications for accessible, compact, and standard stall types.

### **Vehicle Parking**

As noted in a prior section in this report, the project is proposing to provide fewer spaces (221) than minimally required by City parking regulations (320). A parking study conducted concluded that the Project is expected to generate demand for 208 parking spaces, indicating that the parking provided at the Project site will meet parking demand.

<sup>10</sup> <https://www.cityofsanmateo.org/4386/222-E-4th-Ave-Draegers> (Accessed October 2022)

<sup>11</sup> [Standard Drawings | San Mateo, CA - Official Website \(cityofsanmateo.org\)](http://cityofsanmateo.org)

## Driveway Sight Distance

The project proposes to construct a parking garage with a 24 ft wide driveway fronting the north side of 5<sup>th</sup> Avenue. This width is in compliance with City standards (12') when serving more than two off-street parking spaces (Chapter 27.64). The 5<sup>th</sup> Avenue roadway segments that approach the garage ingress/egress do not have severe grade or curves.

Sight distance is the continuous length of the roadway ahead, visible to the roadway user. Sight distance requirements vary depending on roadway speeds. The posted limit on 5<sup>th</sup> Avenue is 25 mph (i.e., design speed of 30 mph). Per the California Department of Transportation (Caltrans) Highway Design Manual 405.1 (2)(d), the corner sight distance requirements do not apply to urban driveways, unless they are signalized. Since this project proposes an unsignalized driveway, per the Caltrans Manual on Uniform Traffic Control Devices (CA MUTCD 2014, Revision 6), a clearance of 6 feet measured from the curb return should be provided at alleys and driveways (Section 3B.19). No on-street parking is proposed on 5<sup>th</sup> Avenue, leaving clear sight lines into and out of the driveway.

This project proposes project driveways that least interfere with traffic movements and vulnerable users per City off-street parking standards (Chapter 27.64). The project proposes to plant Silverleaf Oak trees along 5<sup>th</sup> Avenue, including on either side of the garage entrance and exit. Landscaping must be maintained properly to ensure it does not impede roadway visibility. There are no existing bike lanes on the roadway, however the 2020 Bicycle Master Plan proposes a class II bike lane which would pass by the project driveway. No major conflicts and concerns pertaining to driveway access are evident in the proposed site plan.

## PEDESTRIAN ACCESS

Pedestrians can access the site from entries on Ellsworth Avenue (to the office), B Street (to the public parking, residences, or retail use), or through the 4<sup>th</sup> Ave building frontage (retail use). The project site proposes sidewalks along all the parcel boundaries as well as a pedestrian plaza and parklets at 4<sup>th</sup> Avenue and Ellsworth Avenue. The project would not generate activities that would interfere with access or circulation for people walking to, from, or passing by the site.

## BICYCLE ACCESS

The proposed project would promote accessibility for people biking to the site by providing bicycle parking and a bike lane (Class II) along both sides of 5<sup>th</sup> Avenue between Ellsworth Avenue and B Street. The project would not generate activities that would interfere with access or circulation for people biking.

## BIKE PARKING

The project proposes to provide 38 bicycle parking spaces which includes short- and long-term parking split among the different parcel land uses. A 292 SF bike room will be provided on the ground floor and a 134 SF bike storage facility is located on the fifth floor. Bike racks are proposed along the site on all four sides of the building.

- Long Term Bike Parking
  - Commercial – 10
  - Residential – 10
  - Retail – 1
  
- Short Term Bike Parking
  - Commercial – 5
  - Residential – 1
  - Retail – 14

The ground floor bike room is accessible from the Ellsworth Avenue entrance, separating cyclists from vehicle traffic in the garage and minimizing conflicts between the modes.

## TRANSIT ACCESS

Access to transit facilities and services outlined in the Existing Conditions section will not change with the proposed site plan.

## HAZARDS AND EMERGENCY VEHICLE ACCESS

### ***Loading Zone and Garbage Trucks***

The project proposes to expand the existing 105 ft commercial loading zone on B Street to 120 ft. The project site plans show three trash rooms: a grocery trash room with access on B Street, an office/cafeteria trash room on Ellsworth Avenue, and a residential trash room. Garbage trucks would access trash collector areas via B Street and Ellsworth Avenue.

The project should ensure that access to and from the trash area on B street for garbage trucks does not create or increase conflict with bikes through inadequate site lines or staging within the bike lane. In addition, trash bins should not encroach the public right of way, including the bike lane. The trash bins should be removed from the public right-of-way immediately after garbage pickup as to not impact AM or PM peak hour traffic conditions.

### ***Emergency Vehicle Access***

The nearest fire station (San Mateo Fire Department Station #21) is located approximately 0.2 miles west of the project site at 120 S Ellsworth Ave. The proposed plans indicate that the bulb outs at each intersection surrounding the project site can accommodate the turning radius of a fire truck. Per City requirements, all driveways and drive aisles are at least 20 feet wide and would accommodate Emergency Vehicle access. Therefore, smaller emergency trucks and vans would also be able to access the parking garage.

## 95<sup>TH</sup> PERCENTILE QUEUE ANALYSIS

In addition to the operations analysis, Kittelson also reviewed the changes in 95<sup>th</sup> percentile queue lengths for the study intersections. Queue lengths are typically evaluated as part of the network-level or design-related considerations (i.e., to gauge interaction between nearby intersections). The 95<sup>th</sup> percentile queue lengths are reported to provide an appropriate storage for all but the worst 5% of traffic scenarios. This report provides queue lengths, which are derived from the outputs of the Synchro traffic analysis software and are representative of the 95th percentile traffic volumes<sup>12</sup>. The 95<sup>th</sup> percentile queue length worksheets are provided in Appendix G.

Table 10 through Table 12 show the 95<sup>th</sup> percentile queue lengths for the Existing, Baseline (Opening Year), Baseline (Opening Year) Plus Project, Cumulative, and Cumulative Plus Project conditions. Movements where the expected 95<sup>th</sup> percentile queue length exceeds storage capacity during the weekday peak hours are highlighted in grey in each of the tables shown below.

Storage capacity is exceeded for the following scenarios:

- E 4<sup>th</sup> Ave/B Street, EB and SB approaches – Cumulative Conditions (AM)
- E 4<sup>th</sup> Ave/B Street, EB and SB approaches – Cumulative Conditions (PM)
- E 4<sup>th</sup> Ave/B Street, EB and SB approaches – Cumulative Plus Project Conditions (AM)

<sup>12</sup> Microsimulation of queues using SimTraffic, another analysis software package, was not performed because this model is typically used in the design phase of a project. For a planning level study, industry practice is to use the Synchro outputs.

- E 4<sup>th</sup> Ave/B Street, EB and SB approaches – Cumulative Plus Project Conditions (PM)
- E 4<sup>th</sup> Ave/Ellsworth Avenue, EB approach – Cumulative Conditions (PM)
- E 4<sup>th</sup> Ave/Ellsworth Avenue, EB approach – Cumulative Plus Project Conditions (PM)

Although storage capacity is exceeded in these scenarios, queue lengths do not increase with respect to plus project scenarios when compared to no project scenarios. Thus, the proposed project does not impact the status quo.

**Table 10: 95th Percentile Queue Lengths for Existing Conditions**

#	Location	Scenario	95 <sup>th</sup> Percentile Queue Length (number of vehicles)

RE: **San Mateo Draeger's Traffic Impact Analysis – Project Travel Demand DRAFT**

---

Kittelson & Associates, Inc. (Kittelson) prepared this memorandum for the 222 East 4<sup>th</sup> Avenue Project at the existing Draeger's site in San Mateo, California (Project). The Project proposes to redevelop the existing Draeger Market into a mixed-use building with office, residential, and retail space. Site access will be accommodated for personal and delivery vehicles, bicycles, pedestrians.

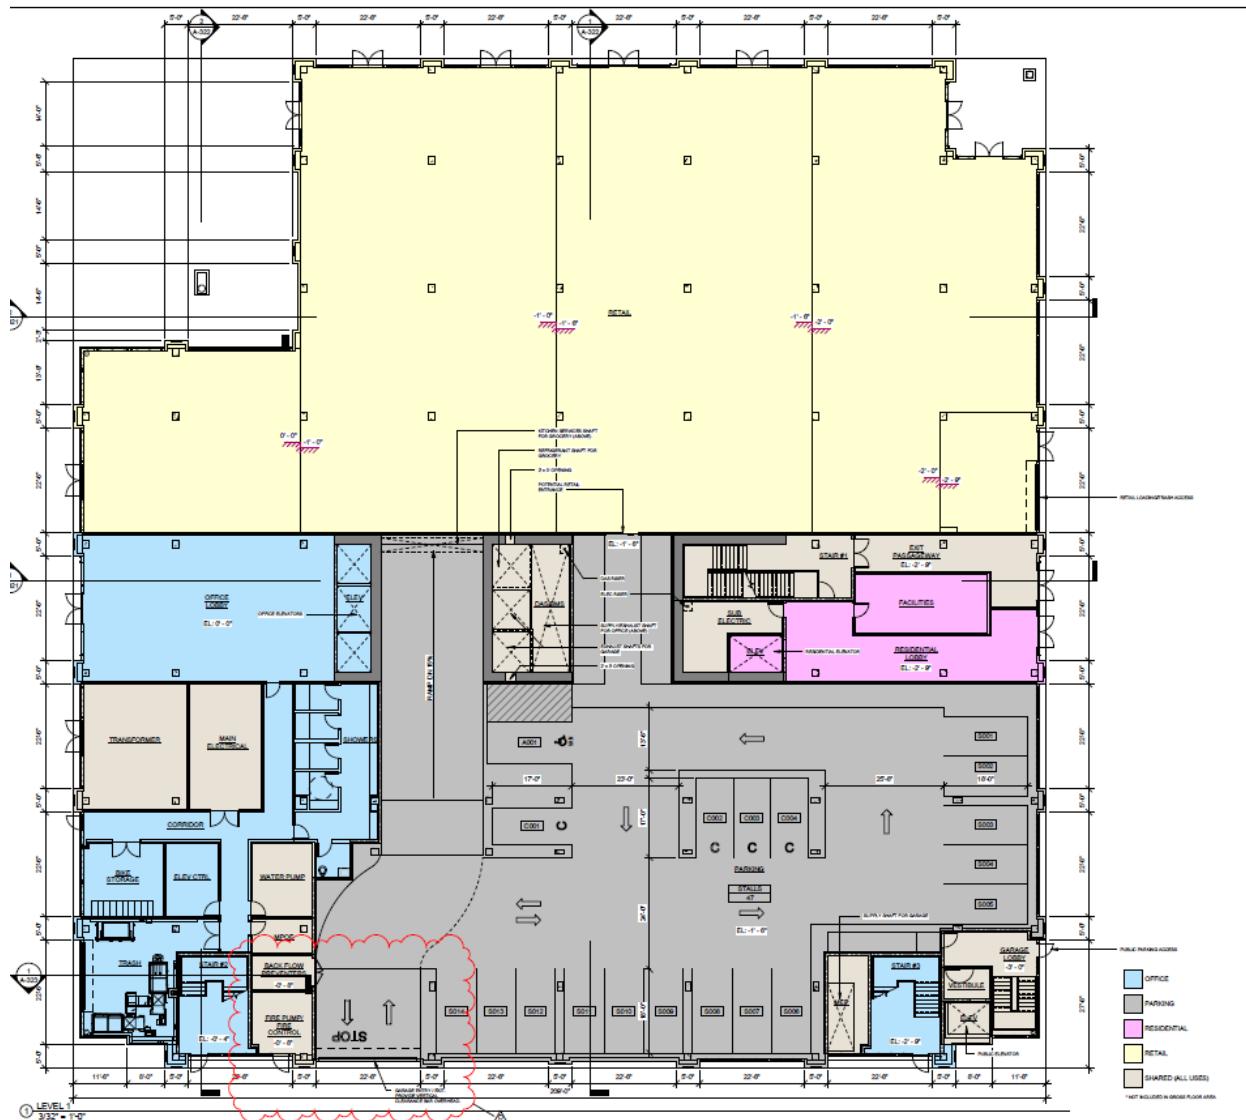

## Project Description

---

Lane Partners is proposing to replace the existing 60,965 square feet Draeger's market located at 222 East 4<sup>th</sup> Avenue with a 5-story, approximately 152,533 square feet mixed-use building with two levels of below grade parking. The building would consist of approximately 104,554 square feet of office space, 17,658 square feet of retail space, and 8,997 square feet of residential space for 10 below-market-rate units at the lower income level. The retail floor would be located on the ground floor, the office space would be spread throughout the first four floors, and the residential space would be split between the ground floor (i.e., residential lobby/elevator) and the fifth floor living areas. The ground floor would also include 12,392 square feet of covered parking area and two levels (89,519 square feet) below grade for a total of 221 parking spaces. The Project site plan is shown in Figure 1.

The Project site is in downtown San Mateo and is zoned as Central Business District/Residential Overlay District – Mixed Use (CBD). The site is also in a designated "Transit Oriented Development" area as it is within a half mile of the San Mateo Caltrain station.

**Figure 1: Proposed Mixed-Use Project Site Plan**

## Existing Conditions

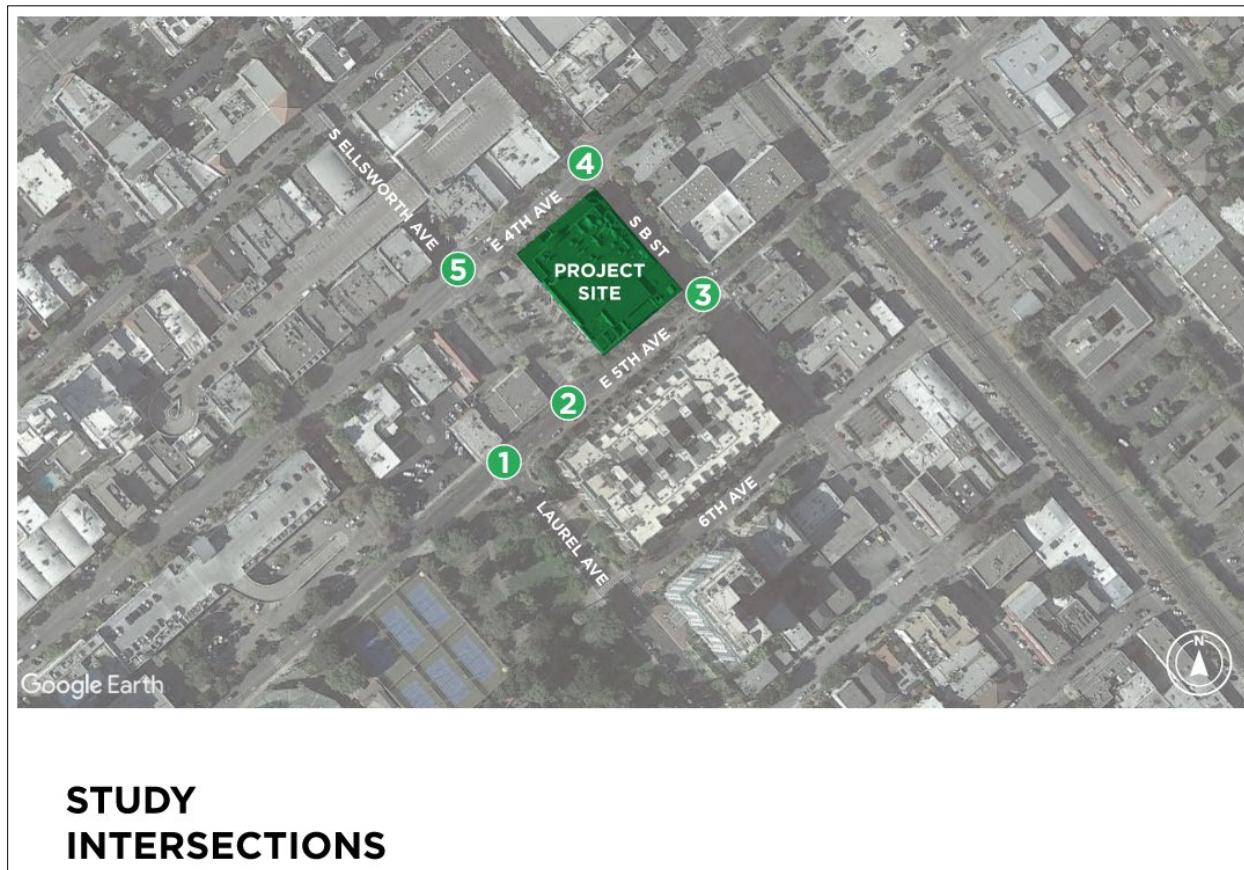

Kittelson obtained the multimodal intersection turning movement counts at three of the five study intersections from the City for the weekday a.m. (7-9 am) and p.m. (4-6 pm) peak period when the existing project site generated trips. The multimodal intersection turning movement counts for the remaining two study intersections were obtained using the Streetlight data. These turning movement counts obtained from Streetlight data were adjusted so that the intersection entry and exit volumes match the adjacent counts collected at the other study intersections.

1. Laurel Avenue/5<sup>th</sup> Avenue (Streetlight data)
2. Ellsworth Avenue/5<sup>th</sup> Avenue (Field collected data)
3. B Street/5<sup>th</sup> Avenue (Field collected data)
4. B Street/4<sup>th</sup> Avenue (Field collected data)

### 5. Ellsworth Avenue/4<sup>th</sup> Avenue (Streetlight data)

Figure 1 illustrates the locations of the five study intersections. Based on the collected counts and adjusted streetlight data at all five intersections, peak hours were 7:45 – 8:45 am and 5:00 – 6:00 pm. The existing volumes (and counts) are summarized in Table 1 and Table 2 for the AM and PM peak hours, respectively.

## Vehicle Trip Generation

### ITE DEVELOPMENT LAND USE CODES

Trip generation is a key consideration for determining local effects of the project on the transportation network. Trip generation rates published in the Institute of Transportation Engineers (ITE) Trip Generation Manual 11<sup>th</sup> Edition were used to estimate the number of trips the mixed-use proposed project would generate. ITE trip estimates are tied to specific land use codes. The ITE land use codes found to be most applicable to the Project are listed below.

- Supermarket (ITE 850)
- General Office Building (ITE 710)
- Affordable Housing (ITE 223)

In addition, this Project is assumed to be in the '**Dense Multi-Use Urban**' context, considered by ITE to be an area that has diverse and interacting complementary land uses with good pedestrian connectivity, and convenient and frequent transit service. This is consistent with the Transit Oriented Development overlay and CBD zoning for the project site for which the San Mateo Municipal code promotes mixed-uses and pedestrian activity. Table 2 below shows the trip generation rates used for the analysis.

**Table 3: Trip Generation Rates, ITE Trip Generation Manual 11<sup>th</sup> Edition**

Land Use	ITE Code	Land Use Context	Units*	Weekday Daily Rate	Weekday AM Peak Hour			Weekday PM Peak Hour		
					Rate	In %	Out %	Rate	In %	Out %
Retail (Supermarket)	850	Dense Multi-Use Urban	1000 SF GFA	107.42	4.99	55%	45%	9.32	50%	50%
Office Space	710	Dense Multi-Use Urban	1000 SF GFA	none provided	0.84	87%	13%	0.87	16%	84%
Office Space	710	General Urban/Suburban <sup>1</sup>	1000 SF GFA	Fitted Curve <sup>2</sup>						
Affordable Housing	223	Dense Multi-Use Urban	DU	3.83	0.5	29%	71%	0.36	61%	39%

\*: GFA – Gross Floor Area, SF – Square Feet, DU – Dwelling Units

<sup>1</sup>: The weekday daily rate for General Urban/Suburban land use was used for Office Space (ITE 710) as no vehicle rate was provided for the Dense Multi-Use Urban land use context.

<sup>2</sup>: ITE 710 (General Urban/Suburban) daily rate fitted curve equation:  $\ln(T) = 0.87 \ln(X) + 3.05$

## TRIP GENERATION CALCULATION

Trip generation estimates for this Project took into consideration three types of trips:

- **Primary or New:** These are the trips whose specific purpose was to visit the site. Primary trip rates were generated using ITE Trip Generation Manual 11<sup>th</sup> Edition.
- **Pass-by:** Drivers already on their way to a destination that stop temporarily at the Project Site without a major roadway diversion are considered making "pass-by" trips. Supermarket 850 is the only land use code in ITE Trip Generation Manual 11<sup>th</sup> Edition for which a pass-by rate was supplied. The 24% average pass-by rate for this land use was only applicable for Weekday PM Peak, resulting in a reduction of 39 trips.
- **Internal:** Trips that occur between land-uses on a multi-use project site and which can be made without using the off-site street network are considered "internal trips". Internal trips for this project can be made by walking between uses. Internal capture was estimated using methodology from NCHRP Report 684 – Enhancing Internal Trip Capture for Mixed-Use Developments.

The existing Draeger's market was included as existing trip credits as it currently generates trips to and from the site. Pass-by trips were also applied to the existing supermarket use.

Table 3 provides a summary of the proposed project's trip generation. As shown in the table, the net new trip generation would be a reduction of 3,645 average daily weekday trips with a reduction of 135 new trips occurring the morning peak and a reduction of 231 new trips occurring the afternoon peak.

**Table 4: Proposed Project Net Trip Generation Calculations**

Land Use	Size	Weekday Daily Trips	Weekday AM Peak Hour			Weekday PM Peak Hour		
			In	Out	Total	In	Out	Total
<b>Proposed Project</b>								
Retail (Supermarket)	17.6 KSF	1,891	48	40	88	82	82	164
Office Space	104.7 KSF	1,208	77	11	88	15	76	91
Affordable Housing	10 DU	38	1	4	5	2	2	4
Internal Capture		-233	-6	-6	-12	-11	-11	-22
Pass-by reduction (24% PM only)		0	0	0	0	-18	-18	-36
<b>Total Proposed Project Trips</b>		<b>2,904</b>	<b>120</b>	<b>49</b>	<b>169</b>	<b>70</b>	<b>131</b>	<b>201</b>
<b>Existing Project</b>								
Retail (Supermarket)	61 KSF	6,549	167	137	304	284	284	568
Pass-by reduction (24% PM only)		0	0	0	0	-68	-68	-136
<b>Total Existing Trips</b>		<b>6,549</b>	<b>167</b>	<b>137</b>	<b>304</b>	<b>216</b>	<b>216</b>	<b>432</b>
<b>Net New Project Trips</b>		<b>-3,645</b>	<b>-47</b>	<b>-88</b>	<b>-135</b>	<b>-146</b>	<b>-84</b>	<b>-231</b>

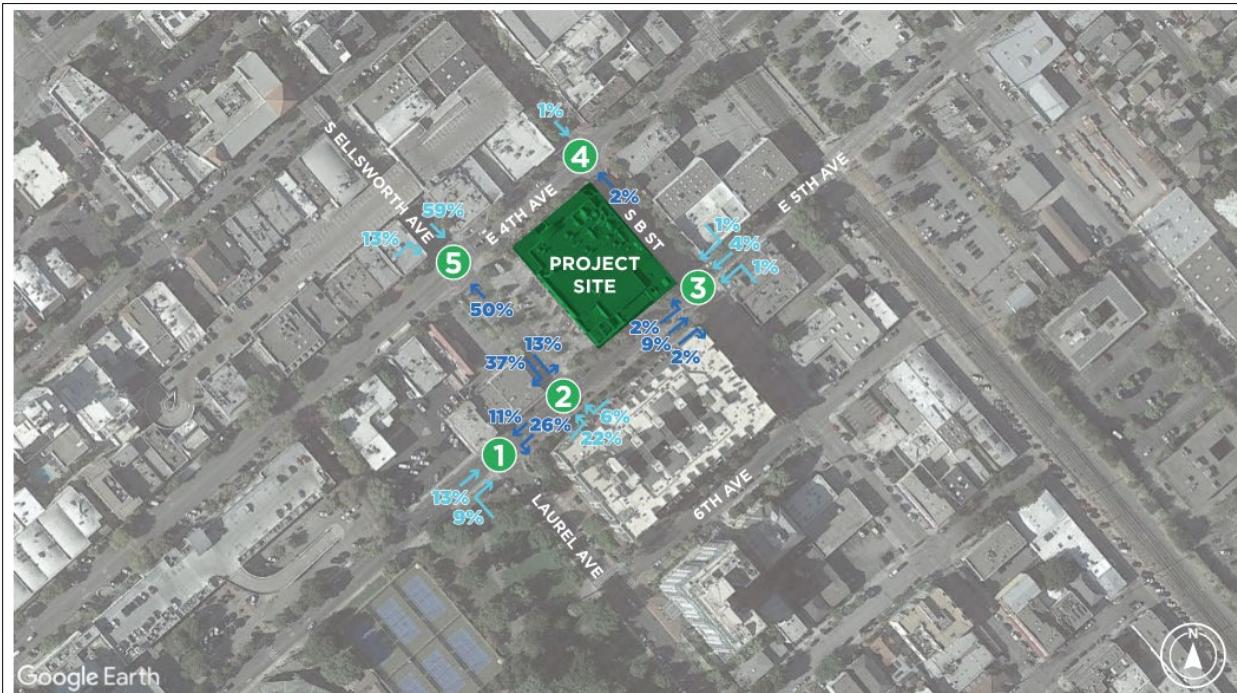

*Note: Updated square footage for the office space portion of the proposed project from 104.7 KSF to 104.5 KSF did not change the proposed project trips generated.*

## Vehicle Trip Distribution

The vehicle trip distribution assumptions are based on the existing counts and proximity to the major arterials and freeways. As shown above, the proposed project would generate less peak hour trips with a reduction of 135 trips in the morning peak hour and 231 trips in the afternoon peak hour when compared to

the trips generated from the existing site. The driveways for the existing site are situated on Ellsworth Avenue, and the driveway for the proposed project site is situated on 5<sup>th</sup> Avenue. Vehicle traffic going to/from the existing and proposed project site are distributed at each intersection according to the turning movement proportions consistent with the existing counts. Existing project vehicle trip distribution percentages are illustrated in Figure 2 and Figure 3 for AM and PM, and proposed project vehicle trip distribution percentages are illustrated in Figure 4 and Figure 5 for AM and PM, respectively. Table 5 and Table 6 illustrate the existing plus project intersection volumes during the weekday AM and weekday PM peak hours, respectively.

**Figure 2: Existing Project Vehicle Trip Distribution (AM)**

\*Note: These volumes do not include existing site generated trips (i.e., existing site generated trips were subtracted from the existing volumes and proposed site generated trips are added to get existing plus project volumes).

## Next Steps

Pending City's review of this memorandum, a determination has to be made whether further traffic analysis is required or not, based on the existing and proposed vehicle trip distribution and intersection volumes.

Queue Delay	0.0	0.4	0.0	0.0
Total Delay	38.0	20.0	23.8	8.9
Queue Length 50th (ft)	148	73	350	41
Queue Length 95th (ft)	#283	m142	#608	85
Internal Link Dist (ft)	667	214	209	237
Turn Bay Length (ft)				
Base Capacity (vph)	617	645	1062	1029
Starvation Cap Reductn	0	47	0	0
Spillback Cap Reductn	0	0	0	0
Storage Cap Reductn	0	0	0	0
Reduced v/c Ratio	0.76	0.66	0.90	0.23

**Intersection Summary**

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.
